Abstract

This manuscript provides the basic documentation for a sophisticated input-output model, called OHFOOD for Ohio food. The model is designed specifically to capture the interdependencies and linkages among various industries composing the complex economy of Ohio. The input-output model of Ohio's economy also is designed to maintain a high degree of detail on the food and agricultural sectors. The input-output model may be used to investigate "shocks" to the economy, such as entry of new firms into the state.

This documentation is intended to provide a brief view of the importance of food and agriculture to the state's economy. The analysis indicates that the food and agricultural sectors of the state contribute approximately 12 percent of the output, 9 percent of the value added, and 15 percent of the total employment.

Of the 5 basic sectors within the food production and distribution chain, food processing is the largest in terms of output, but the wholesaling and retailing sectors are the most significant in terms of value added. The food and agriculture sectors account for nearly 700,000 jobs in Ohio.

The OHFOOD model can be used to assess changes in the structure of the Ohio economy. Keeping the model updated with the latest data available is an on-going task of the Farm Income Enhancement Program and the Department of Agricultural Economics and Rural Sociology of The Ohio State University.

¹Thomas L. Sporleder is Professor and Farm Income Enhancement Endowed Chair, Leroy J. Hushak is Professor, and Dee-Yu Pai is Extension Specialist, Department of Agricultural Economics and Rural Sociology, The Ohio State University.

OHFOOD: An Ohio Food Industries Input-Output Model

Introduction

Measuring production in an economy can be insightful in terms of relationships among various industrial groups. A technique known as input-output modeling endeavors to account for the interdependence of production activities of many different industries comprising the economy. The interdependence captured in the model arises because each industry employs the outputs of other industries as its raw materials. In addition, its output may be used by other producers, or industries, as a factor of production.

To illustrate linkages and interdependencies, consider corn production. Some output from this production activity is input into dry and wet corn milling. The output from milling is input into cattle feeding as is some output directly from corn production. Moving closer to the consumer level, some output from the milling industry is high-fructose corn syrup (HFCS) which in turn is input into the soft drink manufacturing industry. Quantifying, or measuring, these interdependencies and linkages can reveal how much of each industry's output is consumed by other industries compared to how much is available for final consumption or net output.

The food marketing system may be viewed as consisting of five basic components which are vertically linked and interdependent, in an economic sense. The five basic components are farm inputs and machinery, farm production, food processing, food wholesaling and retailing, and finally food service. A diagram of the simplified economic

linkages among these five stages is provided in Figure 1. The four elliptical shapes of the diagram represent final demand components for the output of the other five stages.

Other items of interest derived for each sector of the economy from the input-output model include the amount of direct purchases per dollar of output, total employment, value added, total dollar value of output, and per capita personal consumption expenditures. Each of these economic indicators measures different yet related interdependence among the various sectors of the economy. Of particular interest is the value added measure. Value added is defined for each sector as the market price of goods completed less the cost of materials purchased from others. Thus, value added measures typically are relatively higher for processing activities than for wholesaling activities.

Another useful indicator from input-output analysis is the "multiplier process". Defining several types of multipliers is possible. An income multiplier, for example, is a measure of the intuitive notion that income earned by one individual or industry is spent and becomes income to a second individual or industry. In turn, the second individual spends a portion of that income so that it becomes income to yet another individual. The income multiplier relates an increment in the expenditure of one sector to an increment of income. In essence, when expenditures from one sector increase, the income of other sectors will increase in some multiple of the original increment.

An output multiplier of one sector measures the additional value of production in all contributing sectors of the economy in order to satisfy an extra one dollar demanded for this specified sector. Finally, employment multipliers are derived from output

multipliers simply by converting from an output to employment base. These multipliers indicate the number of jobs created by an extra \$1 million demanded in their industries.

These output and income multipliers provide information for policy makers concerning how much additional production or number of jobs will result from an increase in demand in a specified sector. Likewise, such a multiplier will show the total decline in production or number of jobs within the economy if curtailment occurs in a given sector.

Input-output models provide personal and total income multipliers, output multipliers, and employment multipliers. All of these measures serve to describe both the linkages among sectors within the economy and the relative importance of each sector to the total economy.

Simulation of the economic impact of new firms within an industry is one of the most powerful features of an input-output model. New firms may occur either through new plants or facilities representing net additions to the industry, or by firms relocating from one region to another. The model allows the economy to be "shocked" by adding a new firm of a specific size in terms of employment and output, and to trace the influence of such an event on the entire economy, sector by sector. The ability to perform such simulation is useful information for judging priorities on economic development with a geographic area. The input-output model enables "what-if" scenarios to be analyzed in terms of tracing the effects of changes in one sector on other sectors.

An Ohio Model: OHFOOD

A sophisticated input-output model of the state's economy can capture inter-industry relationships and provide information on the relative and absolute importance of various sectors of the economy. OHFOOD, an acronym for Ohio Food, is an input-output model which includes 40 sectors defined to emphasize agriculture and food processing, food distribution, and food consumption. Many of the 40 sectors are defined based upon the aggregation of similar industries. For example, the "Nursery/Horticulture" sector of OHFOOD is defined so as to include the grass seeds industry, the greenhouse and nursery products industry, and the landscape and horticultural services industry.

The specific definition of sectors within OHFOOD was accomplished by maintaining a high level of detail among the agricultural production and food processing-distribution sectors, but aggregating many other non-food industries into relatively large composite sectors. The specific food and agriculture sectors of OHFOOD are farm input and machinery production, dairy farm products, poultry and egg production, cattle feeding, miscellaneous livestock (such as sheep and goats), swine production, food grain production, feed grain production, miscellaneous crops (such as hay and pasture, tobacco, and tree nuts), fruits and vegetables, oil bearing crops, forestry/fishing, nursery/horticulture, meat and egg processing, dairy processing, processed food and kindred products, grain milling and flour production, soft drink and liquor production, fats and oils production, food distribution, wholesaling and retailing, and finally food services (restaurants and other retail food service). OHFOOD is comprised of 20 sectors related to food and agriculture and 20 which are non-food or industrial and service based. The

detailed four-digit Standard Industrial Classification definition of each sector defined within OHFOOD is provided in Appendix Table A-1.

Methods

The OHFOOD model is based on *IMPLAN*, an input-output algorithm for the national economy using non-survey based data (University of Minnesota). The technology matrix, often called a matrix of "technical coefficients," is based on 1977 relationships for the national economy. Estimates of sectoral activity for final demand, final payments, industry output, and employment for the state are based on 1985 data. Therefore, all price and output changes are in terms of 1985 real dollars.

All input-output models are based upon three important assumptions: fixed coefficient production functions, constant relative prices of inputs and outputs, and production of homogeneous output in each sector (Richardson 1972). A fixed coefficient production function is a linear or first-order approximation of more complex functions. Whether it is an adequate approximation is an empirical issue.

Chenery and Clark (1959), Miernyk (1965) and Richardson (1972) have concluded that a linear approximation is reasonably accurate. The rate of technological change is slow enough that input-output coefficients change slowly over time. Even dated technical coefficients are of value because they provide an upper bound estimate of input requirements (Richardson 1972). That is, as production becomes more efficient over time through technological progress, the inputs required to produce one unit of output are

reduced. The coefficients of the input-output model can be adjusted for price changes, and the frequency with which a model should be modified depends upon price variability.

The output assumption of an input-output model means that each industry or sector produces only one homogenous product. This has implications for the division of a regional economy into economic industries or sectors. In an empirical model, an economy cannot be divided into large composite groupings of industries to define a sector and yet each sector produce a single homogeneous product. The specific definition of sectors always is a compromise between size, in terms of number of sectors of the ultimate model, and the homogeneous product assumption.

Analysis of the Ohio Economy

An overview of the Ohio economy in 1985 is shown by the total output, value added, and employment for each of 40 endogenous sectors, Table 1. The total economic output for Ohio in 1985 was \$315.1 billion with employment of 4,689,608. The output of food and related agricultural sectors was \$36.89 billion, or about 12 percent of Ohio's total economy, Figure 2. The total output of \$36.9 billion may be divided among the five basic components of the food chain, Figure 2. The largest component is food processing, accounting for over \$12 billion of this output or some 33 percent of the total \$36.9 billion food and agriculture output.

Value added is another economic measure of interest. The total value added in the state's economy is \$164.8 billion, with about 9 percent, or some \$15.2 billion, as value added from the food and agricultural sectors, Figure 3. Of the \$15.2 billion value added

by food and agriculture, 56 percent is from the wholesaling, retailing, and food service sectors. Food processors account for another \$3.2 billion value added, or about 21 percent of the total food and agriculture sectors. Farmers account for another 14 percent of the value added, or some \$2.1 billion. Finally, the farm input and machinery sector has value added of \$1.4 billion, or 9 percent of the \$15.2 billion for all of food and agriculture.

The food and agriculture component of the state's economy contributes nearly 700,000 jobs, or about 15 percent of the total, Figure 4. The wholesaling, retailing, and food service sectors account for 70 percent of this total, or over 488,000 jobs. The food processing sector accounts for nearly 60,000 jobs, or 9 percent of the food and agriculture employment. Farm production accounts for over 121,000 and represents 18 percent of the total. The smallest employment sector within the food and agriculture group is farm inputs and machinery, yet this sector employs nearly 26,000 in Ohio.

Total food and agricultural income is approximately 10 percent of total income in the state, Figure 5. The wholesaling, retailing, and food service sectors account for about \$6.6 billion of a total food and agricultural income of \$10.8 billion. Food processing sector income is about \$1.7 billion while farm production income is \$1.8 billion.

Another significant aspect of the food and agricultural component of Ohio's economy is its contribution to exports. OHFOOD tracks exports to other states separately from exports to foreign countries. Examination of the food component of exports to other states reveals that the food service sector exports \$4.5 billion, or 35 percent of the total, Figure 6. Food processors add another 31 percent. Farm production exports \$1.4 billion, or about 11 percent of the total.

Exports to foreign countries are largest for the farm inputs and machinery sector at about \$65 million, or 38 percent of the total food and agricultural component of Ohio's economy, Figure 7. Farmers and food processors account for nearly half of the total foreign exports from Ohio's food and agricultural sectors.

Input-output models consist of three main components: the transaction flow table, the technical coefficients table, and the interdependence coefficients table. The transaction flow table shows all the transactions between the various sectors in an economy. This table can be used to produce a table of technical coefficients which indicate the amount of each input required to produce one unit of output. The interdependence coefficients can be used to estimate the impact on the entire economy of a change in any one sector. The derivations and analysis of these tables follow.

Industry Interdependence - Dollar Flows

The transactions flow table is the core of the input-output model. Information in this table is used to derive the other tables. The economy is divided into processing or production sectors, final demand sectors (household consumption and exports), and primary input sectors (labor and imports). The flow table is a matrix where each row shows the sales by the sector on the left side to each sector composing the columns of the table. Similarly, each column of the table shows the purchases by the sector of that column from each of the other sectors (comprising the rows of the table).

The Ohio transactions flow is in Table 2. For example, the first column shows that dairy farms buy \$26,600 of inputs from other dairy farms, \$12.9 million worth from the

miscellaneous crops sector (primarily hay), \$16.7 million of processed food and kindred products, \$495.9 million of labor, and \$125.8 million of imports to produce \$688.1 million of output. Imports are inputs purchased outside the region. Competitive imports are inputs purchased from sectors currently located in Ohio; non-competitive imports are inputs purchased from sectors not found in Ohio.

Interpretation of the first row is that dairy farms' product sales are distributed as follows: \$26,600 worth sold to other dairy farms, \$1.64 million to the cattle feeding sector, \$8.42 million to the food grains sector, \$551.56 million to the dairy processing sector, \$8.16 million to food service, \$81.7 million to regional consumption and \$27.6 million to exports (outside Ohio) in the final demand sectors.

Finally, transactions within the transaction flows table are constrained by linear fixed coefficient production functions, so that total output is equal to total input for each processing sector. In most cases, exports or imports are treated as residual amounts so that this equality constraint is satisfied. The methods of input-output analysis require the exact sum of outputs to equal inputs for all 40 sectors.

Industry Interdependence - Purchases Per Dollar of Output

The technical coefficients table is based on a fixed coefficient production function for each of the processing or production sectors. The table has estimates of the amount of input from each sector required to produce a unit of output. Technical coefficients are ratios of input from each sector to total inputs from all sectors, derived from the flow table. For example, the coefficient of labor input for dairy farms, 0.7208 (Table 3), is the ratio of

\$495.9 million to \$688.1 million from Table 2. These coefficients are the value of input required from each sector to produce \$1.00 of output in each of the other sectors. For example, to produce \$1.00 in cattle feeding output requires \$0.13 of feed grains and \$0.12 of labor. In the context of the input-output model, these technical coefficients are called the "direct" requirements for the production of a unit of output. This direct purchase of inputs from other sectors is an increase in demand for the output of the other sectors. This increase in demand, in turn, generates the "indirect" effects over several "rounds" of economic activity. That is, the direct effect generates first-round indirect effects, which generate second-round indirect effects, etc. The direct plus all indirect effects equal the total effects shown by the interdependence coefficients.

The Interdependence Coefficients Table

Each interdependence coefficient represents the total value of input from each sector required to provide \$1.00 of output to final demand for the sector of concern. Each \$1.00 supplied to final demand requires more than \$1.00 of total output because of the intermediate product requirements of the processing sectors. For Ohio, to provide \$1.00 of dairy farm product output to final demand requires total product of \$1.00025 from dairy farms and less than \$0.10 each from all the other sectors, Table 4.

Several types of interdependence coefficients tables are used in input-output analysis, of which Types I and II are discussed here. Table 4 is a Type I table; only the processing sectors are used to generate the interdependence coefficients. This means that changes in labor earnings and regional consumption resulting from output changes

do not "feed back" into the determination of total requirements for regional output. Only the direct effects of a change in final demand are incorporated.

In a Type II table, the effects generated by these indirect or secondary labor-consumption effects are called induced effects. To include the "feedback" or induced effects of changes in labor earnings and regional consumption on total requirements, the technical coefficients row for labor and the technical coefficients column for regional consumption are appended to Table 3. Exports and imports are still outside the model. The Type II interdependence coefficients table then also includes a labor row and a regional consumption column. See Richardson (1972) for further discussion of Type II effects.

An important issue in the specification of these tables is the response of other sectors to changes in demand for the output of a given sector. It is relatively easy to estimate the actual transactions among the processing, the final demand, and the primary input sectors. If final demand for a sector increases, however, it is not necessarily true that each of the processing sectors from which inputs are purchased (and regional labor in a Type II model) will expand to provide the increase in inputs demanded by the given sector. If they do not expand, the necessary inputs, such as labor, will be imported. The activity instead "leaks" out of the region. In regions where capital and labor are fully employed, much of these indirect effects and even the direct effect is likely to come through regional imports. The effects then actually impact other regions rather than the one under study.

The Impact Multipliers

Impact coefficients or multipliers are quantitative and summary measures of the total effects that a change in the final demand for a particular sector has on the output, total income, or employment of the regional economy. Type I impact coefficients are discussed here. These are calculated from a Type I interdependence coefficients table, Table 4.

The output multiplier measures the total change in output generated by a \$1.00 change in final demand for the product of a particular sector. It is the sum of the interdependence coefficients and the total requirements for \$1.00 of final demand for that sector's column of the interdependence coefficients table. For example, the output multiplier for dairy farm products of 1.1280 (Table 5) is the sum of the dairy farm products interdependence coefficients in the first column of Table 4.

The income and employment multipliers are similarly defined as the ratio of the total effect (direct plus indirect) to the direct effect. The direct effect is the income (employment) generated within the sector per unit of output. For example, each \$1.00 of output in dairy farm products generates about 69 cents of income; each \$1 million of output generates 49 person-years of employment, Table 5.

The total effect is the column sum of the interdependence coefficients for a particular sector multiplied by the direct effect of the sector from which the inputs are purchased. It is the summation of total income (employment) generated within each sector resulting from a change in the final demand for a specified sector. For example, a \$1.00 change in final demand for feed grain products generates total income of

\$0.5347, where the direct effect is \$0.3268 and the indirect is \$0.2079, Table 5. Similarly, the total employment effect of a \$1 million change in final demand is about 16.3 person-years, of which about 6.4 person-years is indirect effects.

In Table 5, the income multiplier of 1.0756 for dairy farm products is the ratio of 0.7376 to 0.6858. It means that each \$1.00 of income from dairy farms resulting from a change in final demand generates \$1.0756 in total regional income. The employment multiplier of 1.0397 means that each person-year of employment within dairy farms resulting from a change in final demand generates approximately 1.04 person-years in total regional employment.

Conclusions

This manuscript provides the basic documentation for a sophisticated input-output model, called OHFOOD for Ohio food. The model is designed specifically to capture the interdependencies and linkages among various industries composing the complex economy of Ohio. The model is constructed so as to maintain a high degree of detail on the food and agricultural sectors. The input-output model offers exciting possibilities for detailed economic analysis of "shocks" to the economy, such as entry of new firms into the state.

The documentation here is intended only to provide a brief and somewhat cursory view of the importance of food and agriculture to the state's economy. The analysis indicates that the food and agricultural sectors of the state contribute approximately 12 percent of the output, 9 percent of the value added, 15 percent of the total employment, and 10 percent of total income. Of the 5 basic sectors within the food production and

distribution chain, food processing is the largest in terms of output, but the wholesaling and retailing sectors are the most significant in terms of value added. The food and agriculture sectors account for nearly 700,000 jobs in Ohio.

The OHFOOD model can be used to assess changes in the structure of the Ohio economy. Keeping the model updated with the latest information available will be an ongoing task of the Farm Income Enhancement Program and the Department of Agricultural Economics and Rural Sociology of The Ohio State University.

Table A-1. OHFOOD: Ohio Input-Output Model Endogenous Sector Definitions

Sector Name	Standard Industrial Classification (SIC)
<u>Food and Related Agriculture Sectors</u>	
1. Dairy Farms	0241, part of 0191, 0259, 0291
2. Poultry and Egg	0251, 0252, 0253, part of 0191, 0219, 0259, 0291
3. Cattle Feeding	Ranch Fed Cattle; Range Fed Cattle; Cattle Feedlots. (0211, part of 0191, 0212, 0219, 0259, 0291)
4. Other Livestock	Sheep, Lambs and Goats; Other Meat Animal Products; Misc. Livestock. (0214, 0271, 0272, part of 0191, 0219, 0259, 0291)
5. Swine	0213, part of 0191, 0219, 0259, 0291
6. Food Grains	0111, 0112, part of 0191, 0219, 0259, 0291
7. Feed Grains	0115, part of 0139, 0191, 0219, 0259, 0291
8. Other Crops	Cotton; Hay and Pasture; Tobacco; Tree Nuts; Sugar Crops; Misc Crops. (0131, 0132, 0133, part of 0119, 0139, 0173, 1079, 0191, 0219, 0259, 0291)
9. Nursery/Horticulture	Grass Seeds; Greenhouse & Nursery Products; Landscape & Hort. Services. (0182, 0189, 0780, part of 0139, 0191, 0219, 0259, 0291)
10. Fruits and Vegetables	Fruits; Vegetables. (0134, 0161, 0171, 0172, 0174, 0175, part of 0119, 0139, 0179, 0191, 0219, 0259, 0291)
11. Oil Bearing Crops	0116, part of 0119, 0139, 0173, 0219, 0259, 0291
12. Forestry/Fishing/Ag Services	Forest Products; Forestry Products; Commercial Fishing. (0710, 0720, 0750, 0760, 0254, 0810, 0820, 0840, 0850, 0910, 0920, 0970, part of 0181, 0191, 0219, 0259, 0279, 0291)
13. Processed Meats/Eggs	Meat Packing Plants; Sausages & Other Prepared Meat; Poultry Dressing Plant; Poultry & Egg Processing; Fresh or Frozen Packaged Fish. (2011, 2013, 2016, 2017, 2092)
14. Dairy Processing	Creamery Butter; Cheese, Natural and Processed; Condensed & Evaporated Milk; Ice Cream & Frozen Desserts; Fluid Milk. (2021, 2022, 2023, 2024, 2026)
15. Processed Food and Kindred Products	Canned & Cured Sea Foods; Canned Specialties; (2091, 2032, 2033, 2034, 2035, 2037, 2038, 2047, 2048, 2051, 2067, 2087, 2095, 2097, 2098, 2099, 2110, 2120, 2130, 2140)
16. Grain Milling/Flour	Flour & Other Grain Mill Prod.; Cereal Preparations; Rice Milling; (2041, 2043-2046)
17. Soft Drinks/Liquor	Malt Liquors; Malt; Wines; (2082-2086)
18. Fats/Oils	Cottonseed Oil Mills; Soybean Oil Mills; Vegetable Oil Mills, N.E.C.; (2074-2077, 2079)
19. Farm Inputs/Machinery	Industrial Inorganic; Nitro. Fertilizer; Agricultural Chemicals; (2810, 2865, 2869, 2873, 2874, 2875, 2879, 3523, 3524, 3535, 3551, part of 2819)
20. Food Services	5800, part of 70

Table A-1. OHFOOD: Ohio Input-Output Model Endogenous Sector Definitions (Continued.)

Sector Name	BEA Commodity
<u>Non-Agricultural Sectors</u>	
21. Mining	1011, 1021, 1031, 1041, 1044, 1051, 1062, 1081, 1092, 1094, 1099, 1111, 1211, 1310, 1321, 1411, 1422, 1423, 1429, 1442, 1446, 1452, 1453, 1454, 1455, 1459, 1472-1477, 1481, 1492, 1496, 1499, part of 1112, 1213
22. Construction	1380, 1520, 1522, 1530, 1541, 1542, 1611, 1622, 1623, part of 1629
23. Metal Industries	3312, 3313, 3315, 3316, 3317, 3320, 3331, 3332, 3334, 3339, 3340, 3351, 3353-3357, 3361, 3362, 3369, 3398, 3399, 3462, 3463, 3482, 3483, 3484, 3489, 3761, 3795
24. Apparel/Yarn/Leather	2210, 2220, 2230, 2240, 2251-2254, 2257-2259, 2261, 2262, 2269, 2270, 2281-2284, 2291-2299, 2310, 2320, 2330, 2340, 2350, 2360, 2370, 2380, 2391-2397, 2399, 3110, 3130, 3142, 3143, 3144, 3149, 3150, 3160, 3171, 3172, 3190, 3962, 3963, 3964, 3991, 3996, 3999
25. Wood/Paper/Publishing	2410, 2421, 2426, 2429, 2431, 2434, 2435, 2436, 2439, 2441, 2448, 2449, 2452, 2491, 2492, 2499, 2511, 2512, 2514, 2515, 2517, 2519, 2521, 2522, 2531, 2541, 2542, 2591, 2599, 2610, 2620, 2630, 2641, 2642, 2643, 2645, 2646, 2647, 2648, 2649, 2650, 2660, 2710, 2720, 2731, 2732, 2740, 2750, 2752, 2753, 2754, 2760, 2770, 2782, 2789, 2791, 2793, 2794, 2795
26. Chemical/Petroleum	2821-2824, 2830, 2841-2844, 2850, 2861, 2891, 2892, 2893, 2895, 2899, 2910, 2951, 2952, 2992, 2999, 3010, 3020, 3030, 3040, 3060, 3070
27. Stone/Clay/Glass	3210, 3221, 3229, 3230, 3240, 3253, 3255, 3259, 3261-3264, 3269, 3271-3275, 3280, 3291, 3292, 3293, 3295, 3296, 3297, 3299
28. Machinery and Equipment	3511, 3519, 3523, 3524, 3531-3537, 3541-3547, 3549, 3551-3555, 3559, 3561-3569, 3592, 3599, 3581, 3582, 3585, 3586, 3589, 3612, 3613, 3621-3624, 3629, 3631-3636, 3639, 3641, 3643-3648, 3825
29. Technology Industries	3572-3574, 3576, 3579, 3651, 3652, 3661, 3662, 3671-3679, 3691-3694, 3699, 3811, 3822-3824, 3829, 3830, 3841-3843, 3850, 3860, 3870, 3911, 3914, 3915, 3930, 3942, 3944, 3949, 3951-3953, 3955, 3961
30. Motor Vehicle Equipment	2451, 3711, 3713-3716, 3721, 3724, 3728, 3731, 3732, 3740, 3750, 3764, 3769, 3792, 3799
31. Misc. Service	3993, 3995, 7000, 7210, 7220, 7230, 7240, 7250, 7260, 7290, 7310, 7320, 7331, 7332, 7333, 7339, 7340, 7350, 7360, 7370, 7391-7395, 7397, 7399, 7620, 7630, 7640, 7690
