Abstract

This manuscript provides the basic documentation for a sophisticated input-output model, called OHFOOD for Ohio food. The model is designed specifically to capture the interdependencies and linkages among various industries composing the complex economy of Ohio. The input-output model of Ohio's economy also maintains a high degree of detail on the food and agricultural sectors. The interindustry model may be used to investigate "shocks" to the economy, such as entry of new firms into the state.

This documentation provides a brief view of the importance of food and agriculture to the state's economy based on the interindustry model. The analysis indicates that the food and agricultural sectors of the state contribute approximately 12 percent of the output, 10 percent of the value added, 15 percent of the total employment, and 9 percent of total income.

Of the 5 basic sectors within the food production and distribution chain, food processing is the largest in terms of output, but the wholesaling and retailing sectors are the most significant in terms of value added. The food and agriculture sectors account for nearly 700,000 jobs in Ohio.

The OHFOOD model can be used to assess changes in the structure of the Ohio economy. Keeping the model updated with the latest data available is an ongoing task of the Farm Income Enhancement Program and the Department of Agricultural Economics and Rural Sociology of The Ohio State University.

OHFOOD: An Ohio Food Industries Input-Output Model

Introduction

Measuring production in an economy can be insightful in terms of relationships among various industrial groups. A technique known as input-output modeling endeavors to account for the interdependence of production activities of many different industries comprising the economy. The interdependence captured in the model arises because each industry employs the outputs of other industries as its raw materials. In addition, its output may be used by other producers, or industries, as a factor of production.

To illustrate linkages and interdependencies, consider corn production. Some output from this production activity is input into dry and wet corn milling. The output from milling is input into cattle feeding as is some output directly from corn production. Moving closer to the consumer level, some output from the milling industry is high-fructose corn syrup (HFCS) which in turn is input into the soft drink manufacturing industry. Quantifying, or measuring, these interdependencies and linkages can reveal how much of each industry's output is consumed by other industries compared to how much is available for final consumption or net output.

The food marketing system may be viewed as consisting of five basic components which are vertically linked and interdependent, in an economic sense. The five basic components are farm inputs and machinery, farm production, food processing, food wholesaling and retailing, and finally food service. A diagram of the simplified economic linkages among these five stages is provided in Figure 1. The four elliptical shapes of the

diagram represent final demand components for the output of the other five stages. The arrows indicate economic flows, in terms of dollars of output, from one sector which becomes input to another sector.

For each industry or sector of the economy, estimates of the amount of direct purchases per dollar of output are obtained from the interindustry model. In addition, other economic measures of interest derived for each sector of the economy from the input-output model include total employment, value added, and the total dollar value of output. Each of these economic indicators measures different yet related interdependence among the various sectors of the economy.

Another useful indicator from input-output analysis is the "multiplier." An output multiplier for a sector, for example, measures the additional value of production of all sectors of the economy necessary to satisfy an extra dollar demanded from that specific sector. Output multipliers can be the basis for analyzing the importance of each industry in terms of its overall influence on the economy.

Other multipliers include income and employment. An income multiplier is a measure of the intuitive notion that income earned by one individual or industry is spent and becomes income to a second individual or industry. In turn, the second individual spends a portion of that income so that it becomes income to yet another individual. The income multiplier relates an increment in the income of one sector to an increment of income of other sectors. In essence, when expenditures from one sector increase, the income of other sectors will increase in some multiple of the original increment.

Finally, employment multipliers are derived from output multipliers simply by converting from an output to employment base. The "total effect" multipliers indicate the number of jobs created for each \$1 million expansion in demand in their industries. The employment multiplier provided herein for each sector relates an increment in the employment within that sector to an increment in employment among all other sectors. These multipliers provide information on how much additional production or number of jobs will result from an increase in demand in a specified sector. Likewise, such a multiplier will show the total decline in production or number of jobs within the economy if curtailment occurs in a given sector. All of these measures serve to describe both the linkages among sectors within the economy and the relative importance of each sector to the total economy.

Simulation of the economic impact of new firms within an industry is one of the most powerful features of an input-output model. New firms may occur either through new plants or facilities representing net additions to the industry, or by firms relocating from one region to another. The model allows the economy to be "shocked" by adding a new firm of a specific size in terms of employment and output, and to trace the influence of such an event on the entire economy, sector by sector. The ability to perform such simulation is useful information for judging priorities on economic development with a geographic area. The input-output model enables "what-if" scenarios to be analyzed in terms of tracing the effects of changes in one sector on other sectors.

An Ohio Model: OHFOOD

Sector Definition

A sophisticated input-output model of the state's economy can capture interindustry relationships and provide information on the relative and absolute importance of various sectors of the economy. OHFOOD, an acronym for Ohio Food, is an input-output model which includes 40 sectors defined to emphasize agriculture and food processing, food distribution, and food consumption. Many of the 40 sectors are defined based upon the aggregation of similar industries. For example, the "Nursery/Horticulture" sector of OHFOOD is defined to include the grass seeds industry, the greenhouse and nursery products industry, and the landscape and horticultural services industry.

The specific definition of sectors within OHFOOD was accomplished by maintaining a high level of detail among the agricultural production and food processing-distribution sectors, but aggregating many other non-food industries into relatively large composite sectors. The specific food and agriculture sectors of OHFOOD are farm input and machinery production, dairy farm products, poultry and egg production, cattle feeding, miscellaneous livestock (such as sheep and goats), swine production, food grain production, feed grain production, miscellaneous crops (such as hay and pasture, tobacco, and tree nuts), fruits and vegetables, oil bearing crops, forestry/fishing, nursery/horticulture, meat and egg processing, dairy processing, processed food and kindred products, grain milling and flour production, soft drink and liquor production, fats and oils production, food distribution, wholesaling and retailing, and finally food services (restaurants and other retail food service). OHFOOD is comprised of 20 sectors related

to food and agriculture and 20 which are non-food or industrial and service based. The detailed four-digit Standard Industrial Classification (SIC) definition of each sector defined within OHFOOD is provided in Appendix Table A-1.

Methods

The OHFOOD model is based on *IMPLAN*, an input-output algorithm for the national economy using non-survey based data (University of Minnesota). *IMPLAN* is based on a procedure developed by the U.S. Forest Service for estimating input-output models for the United States or subregions (Alward). Estimates of sectoral activity for final demand, final payments, industry output, and employment for the Ohio economy are based on the latest data available for 577 sectors of the United States economy. All price and output information within the model are in 1985 dollars. The technology matrix, often called a matrix of "technical coefficients," is based on 1977 relationships for the national economy. Again, these data are the latest published data available from the Bureau of Economic Analysis of the U.S. Department of Commerce at the time of this analysis. Detail of the methods of input-output modeling for an economy and the methods used for calculations of multipliers may be found in Miller and Blair.

An input-output model also may be used to identify the relative importance among various food and agriculture sectors of the economy in terms of their potential for increasing output in the general economy of Ohio. This type of analysis compares all industries or sectors based on their estimated output multipliers. The relative ranking of various sectors of the Ohio economy, in terms of influence or "ripple" effects on the rest

of the economy, was calculated using the output multipliers reported in detail in Table 5. Prior to comparison among sectors, the output multipliers provided in Table 5 for each sector were deflated by their respective diagonal element of the Leontief inverse matrix, as reported in Table 4. This procedure allows a comparison based on the influence of each sector's output expansion potential, rather than a change in final demand within the Ohio economy.

Analysis of the Ohio Economy

Basic Economic Linkages

An overview of the Ohio economy in 1985 is shown by the total output, value added, and employment for each of 40 endogenous sectors, Table 1. The total economic output for Ohio in 1985 was \$320.5 billion with employment of 4,682,139. The output of food and related agricultural sectors was \$39.5 billion, or about 12 percent of Ohio's total economy, Figure 2. The total output of \$39.5 billion may be divided among the five basic components of the food chain, Figure 2. The largest component is food processing, accounting for nearly \$12 billion of this output or some 30 percent of the total \$39.5 billion food and agriculture output.

Agricultural production adds over \$6 billion in output, or about 15 percent of the total output from the food and agriculture sectors of the economy. The largest component within the agricultural production sector is feed grains, accounting for nearly \$1.2 billion in output. The Ohio livestock sectors combined account for \$2.95 billion in output, or approximately 49 percent of the \$6.1 billion total agricultural production output,

Figure 3. Crop sectors account for another 49 percent of the total output from the agricultural production sector, Figure 4.

Value added is another economic measure of interest. The total value added in the state's economy is \$172.3 billion, with nearly 10 percent, or some \$16.6 billion, as value added from the food and agricultural sectors, Figure 5. Of the \$16.6 billion value added by food and agriculture, 34 percent is from the wholesaling and retailing sector, and another 26 percent is from the food service sector. Food processors account for another \$3.1 billion value added, or about 18 percent of the total food and agriculture sectors. Agricultural producers account for another 13 percent of the value added, or some \$2.0 billion. Finally, the farm input and machinery sector has value added of \$1.3 billion, or 8 percent of the \$16.6 billion for all of food and agriculture.

The food and agriculture component of the state's economy contributes nearly 700,000 jobs, or about 15 percent of the total, Figure 6. The wholesaling, retailing, and food service sectors account for 70 percent of this total, or over 488,000 jobs. The food processing sector accounts for nearly 60,000 jobs, or nearly 9 percent of the food and agriculture employment. Farm production accounts for over 117,000 and represents 17 percent of the total. The smallest employment sector within the food and agriculture group is farm inputs and machinery, yet this sector employs nearly 26,000 people in Ohio, Table 1.

Total food and agricultural income is approximately 9 percent of total income in the state, Figure 7. The wholesaling, retailing, and food service sectors account for about \$7.6 billion of a total food and agricultural income of \$13.8 billion, or about 55 percent of

the total food and agriculture sector income. Food processing sector income is about \$2.8 billion while farm production income is \$2.0 billion, Table 1.

Ohio livestock sectors combined account for \$912 million in income, or approximately 45 percent of the \$2.0 billion total income from the ag production sector, Figure 8. Dairy farms accounted for 45 percent of the total income from the livestock sector, while poultry and egg production accounted for another 13 percent. Crop sectors account for about 53 percent, or \$1.1 billion, of the total income from the ag production sector, Figure 9.

Another significant aspect of the food and agricultural component of Ohio's economy is its contribution to exports. OHFOOD tracks exports to other states separately from exports to foreign countries. Examination of the food component of exports to other states reveals that the food service sector exports \$5.9 billion, or 35 percent of the total, Figure 10. Food processors add another 31 percent, or \$5.3 billion. Farm production exports \$2.6 billion, or about 15 percent of the total.

Exports to foreign countries are largest for the farm inputs and machinery sector at about \$63 million, or 36 cents of every export dollar from the food and agricultural component of Ohio's economy, Figure 11. Farmers and food processors combined account for 45 cents of every foreign export dollar from Ohio's food and agricultural sectors.

Food and Agriculture Economic Development Potential

Leading agricultural production sectors with the most economic influence on the remainder of Ohio's economy include feed grains, food grains, hay/sugar/nut crops, oil bearing crops, and the fruits and vegetables sector, Figure 12. For example, for each \$1.00 expansion in output from the feed grains sector, the Ohio economy would gain a total output change of \$1.58, a "leverage" factor of 58 percent. Similarly, each \$1.00 expansion in the food grains sector results in total output change of \$1.54 in Ohio's economy.

Value-added food processing sectors also were compared regarding their relative impacts on the Ohio economy. The meat and egg processing sector would create an additional \$0.61 in the Ohio economy's output for each dollar of sector output expansion, Figure 13. Other leading food processing industries with substantial influence on the state's economy include the fats and oils processing sector, processed food and kindred products, dairy processing, grain milling, and beverage processing.

Industry Interdependence - Dollar Flows

Input-output models consist of three main components: the transaction flow table, the technical coefficients table, and the interdependence coefficients table. The transaction flow table shows all the transactions between the various sectors in an economy. This table can be used to produce a table of technical coefficients which indicate the amount of each input required to produce one unit of output. The

interdependence coefficients can be used to estimate the impact on the entire economy of a change in any one sector. The derivations and analysis of these tables follow.

The transactions flow table is the core of the input-output model. Information in this table is used to derive the other tables. The economy is divided into processing or production sectors, final demand sectors (household consumption and exports), and primary input sectors (labor and imports). The flow table is a matrix where each row shows the sales by the sector on the left side to each sector composing the columns of the table. Similarly, each column of the table shows the purchases by the sector of that column from each of the other sectors (comprising the rows of the table).

The Ohio transactions flow is in Table 2. An example of the interpretation of selected transaction flows recorded in Table 2 illustrates the meaning of the numbers in this table. To illustrate, the second column shows that dairy farms buy \$366,730 of inputs from other dairy farms, \$7.15 million worth from the hay/sugar/nut crops sector (primarily hay), \$19.67 million from the feed grains sector, \$539.4 million of labor, and \$314.2 million of imports to produce \$969.2 million in output. Imports are inputs purchased outside the region. Competitive imports are inputs purchased from sectors currently located in Ohio; non-competitive imports are inputs purchased from sectors not found in Ohio.

Interpretation of selected numbers from the second row of Table 2 shows that dairy farms' product sales are distributed as follows: \$366,730 sold to other dairy farms, \$802,470 to the cattle feeding sector, \$9.84 million to the feed grains sector, \$304.12 million to the dairy processing sector, \$8.0 million to food service, and \$503.2 million to exports (outside Ohio) in the final demand sectors. In general, the columns provide the

purchases from each sector of the economy while the rows provide the amount of output sold from the individual sector to each of the other sectors of the economy.

Finally, transactions within the transaction flows table are constrained by linear fixed coefficient production functions, so that total output is equal to total input for each processing sector. In most cases, exports or imports are treated as residual amounts so that this equality constraint is satisfied. The methods of input-output analysis require the exact sum of outputs to equal inputs for all 40 sectors.

Industry Interdependence - Purchases Per Dollar of Output

The technical coefficients table is based on a fixed coefficient production function for each of the processing or production sectors. The table has estimates of the amount of input from each sector required to produce a unit of output. Technical coefficients are ratios of input from each sector to total inputs from all sectors, derived from the flow table. For example, the coefficient of labor input for dairy farms, 0.5565 (Table 3), is the ratio of \$539.4 million to \$969.3 million from Table 2. These coefficients are the value of input required from each sector to produce \$1.00 of output in each of the other sectors. For example, to produce \$1.00 in swine sector output requires about \$0.04 of feed grains and \$0.19 of labor. In the context of the input-output model, these technical coefficients are called the "direct" requirements for the production of a unit of output. This direct purchase of inputs from other sectors is an increase in demand for the output of the other sectors. This increase in demand, in turn, generates the "indirect" effects over several "rounds" of economic activity. That is, the direct effect generates first-round indirect

effects, which generate second-round indirect effects, etc. The direct plus all indirect effects equal the total effects shown by the interdependence coefficients.

The Interdependence Coefficients Table

Each interdependence coefficient represents the total value of input from each sector required to provide \$1.00 of output to final demand for the sector of concern. Each \$1.00 supplied to final demand requires more than \$1.00 of total output because of the intermediate product requirements of the processing sectors. For Ohio, to provide \$1.00 of dairy farm product output to final demand requires total product of \$1.00065 from dairy farms and \$0.02 or less from all the other sectors, Table 4. In input-output terminology, Table 4 is a Type I table; only the processing sectors are used to generate the interdependence coefficients. This means that changes in labor earnings and regional consumption resulting from output changes do not "feed back" into the determination of total requirements for regional output. Only the direct effects of a change in final demand are incorporated.

In a Type II table, the effects generated by these indirect or secondary labor-consumption effects are called induced effects. To include the "feedback" or induced effects of changes in labor earnings and regional consumption on total requirements, the technical coefficients row for labor and the technical coefficients column for regional consumption are appended to Table 3. Exports and imports are still outside the model. The Type II interdependence coefficients table then also includes a labor row and a regional consumption column. See Richardson (1972) for further discussion of Type II effects.

An important issue in the specification of these tables is the response of other sectors to changes in demand for the output of a given sector. It is relatively easy to estimate the actual transactions among the processing, the final demand, and the primary input sectors. If final demand for a sector increases, however, it is not necessarily true that each of the processing sectors from which inputs are purchased (and regional labor in a Type II model) will expand to provide the increase in inputs demanded by the given sector. If they do not expand, the necessary inputs, such as labor, will be imported. The activity instead "leaks" out of the region. In regions where capital and labor are fully employed, much of these indirect effects and even the direct effect is likely to come through regional imports. The effects then actually impact other regions rather than the one under study.

The Impact Multipliers

Impact coefficients or multipliers are quantitative and summary measures of the total effects that a change in the final demand for a particular sector has on the output, total income, or employment of the regional economy.

The output multiplier of a particular sector measures the total change in output generated by a \$1.00 change in final demand for the product of a particular sector. It is the sum of the interdependence coefficients and the total requirements for \$1.00 of final demand for that sector's column of the interdependence coefficients table. For example, the output multiplier for dairy farm products of 1.1653 (Table 5) is the sum of the dairy farm products interdependence coefficients in that sector's column of Table 4.

The income and employment multipliers are similarly defined as the ratio of the total effect (direct plus indirect) to the direct effect. The direct effect is the income (employment) generated within the sector per unit of output. For example, each \$1.00 of output in dairy farm products generates about 55 cents of income; each \$1 million of output generates 30 person-years of employment, Table 5.

The total effect is the column sum of the interdependence coefficients for a particular sector multiplied by the direct effect of the sector from which the inputs are purchased. It is the summation of total income (employment) generated within each sector resulting from a change in the final demand for a specified sector. For example, a \$1.00 change in final demand for feed grain products generates total income of \$0.6979, where the direct effect is \$0.2430 and the indirect is \$0.4549, Table 5. Similarly, the total employment effect of a \$1 million change in final demand is about 23.8 person-years, of which about 11.0 person-years is direct effects and the remaining 12.8 person-years of employment is in indirect effects.

In Table 5, the income multiplier of 1.7003 for dairy farm products is the ratio of 0.9274 to 0.5454. It means that each \$1.00 of income from dairy farms resulting from a change in final demand generates \$1.7003 in total regional income. The employment multiplier of 1.3954 means that each person-year of employment within dairy farms resulting from a change in final demand generates approximately 1.4 person-years in total employment in Ohio.

Conclusions

OHFOOD is a sophisticated input-output model designed specifically to capture the interdependencies and linkages among various industries composing the complex economy of Ohio. The model is constructed so as to maintain meaningful detail on the food and agricultural sectors. The input-output model offers some descriptive information on the importance of food and agriculture to the economy of Ohio.

The documentation reported in this manuscript is intended only to provide a brief and somewhat cursory view of the importance of food and agriculture to the state's economy. Substantially more detail is available from the numbers reported in the tables. The analysis indicates that the food and agricultural sectors of the state contribute approximately 12 percent of the output, 10 percent of the value added, 15 percent of the total employment, and 9 percent of total income. Of the 5 basic sectors within the food production and distribution chain, food processing is the largest in terms of output, but the wholesaling and retailing sectors are the most significant in terms of value added. The food and agriculture sectors account for nearly 700,000 jobs in Ohio.

The **OHFOOD** model can be used to assess changes in the structure of the Ohio economy. Keeping the model updated with the latest information available will be an on-going task of the Farm Income Enhancement Program and the Department of Agricultural Economics and Rural Sociology of The Ohio State University.

Note: Each sector's output, value added, income, and employment are provided through U.S. Census information. The wholesaling and retailing sector is treated as one sector for purposes of the input-output model definition, but this sector is disaggregated for purposes of Table 1. The disaggregation procedure used is to break all wholesale/retail into food and non-food wholesale/retail. The percentage of all wholesale/retail payroll and employment solely from food wholesale/retail in Ohio is estimated using data published by County Business Patterns, 1985. The percentage of payroll is used to estimate the proportion of agriculture and food outputs, value added, and income. Similarly, the percentage of employment is used to adjust employment.

Table 2. Transactions Flow for Ohio, 1985

Table A-1. OHFOOD: Ohio Input-Output Model Endogenous Sector Definitions

Sector Name	Standard Industrial Classification (SIC)
<u>Food and Related Agriculture Sectors</u>	
1. Farm Inputs/Machinery	Industrial Inorganic; Nitro. Fertilizer; Agricultural Chemicals; Farm Machinery (2810, 2865, 2869, 2873, 2874, 2875, 2879, 3523, 3524, 3535, 3551, part of 2819)
2. Dairy Farms	0241; part of 0191, 0259, and 0291
3. Poultry and Egg	0251; 0252; 0253; part of 0191, 0219, 0259, and 0291
4. Cattle Feeding	Ranch Fed Cattle; Range Fed Cattle; Cattle Feedlots. (0211; part of 0191, 0212, 0219, 0259, and 0291)
5. Swine	0213; part of 0191, 0219, 0259, and 0291
6. Other Livestock	Sheep, Lambs and Goats; Other Meat Animal Products; Misc. Livestock. (0214; 0271; 0272; part of 0191, 0219, 0259, and 0291)
7. Food Grains	0111; 0112; part of 0191, 0219, 0259, and 0291
8. Feed Grains	0115; part of 0139, 0191, 0219, 0259, and 0291
9. Other Crops	Cotton; Hay and Pasture; Tobacco; Tree Nuts; Sugar Crops; Misc Crops. (0131; 0132; 0133; part of 0119, 0139, 0173, 1079, 0191, 0219, 0259, and 0291)
10. Nursery/Horticulture	Grass Seeds; Greenhouse & Nursery Products; Landscape & Hort. Services. (0182; 0189; 0780; part of 0139, 0191, 0219, 0259, and 0291)
11. Fruits and Vegetables	Fruits; Vegetables. (0134; 0161; 0171; 0172; 0174; 0175; part of 0119, 0139, 0179, 0191, 0219, 0259, and 0291)
12. Oil Bearing Crops	0116; part of 0119, 0139, 0173, 0219, 0259, and 0291
13. Forestry/Fishing/ Ag Services	Forest Products; Forestry Products; Commercial Fishing. (0710; 0720; 0750; 0760; 0254; 0810; 0820; 0840; 0850; 0910; 0920; 0970; part of 0181, 0191, 0219, 0259, 0279, and 0291)
14. Processed Meats/Eggs	Meat Packing Plants; Sausages & Other Prepared Meat; Poultry Dressing Plant; Poultry & Egg Processing; Fresh or Frozen Packaged Fish. (2011; 2013; 2016; 2017; 2092)
15. Dairy Processing	Creamery Butter; Cheese, Natural and Processed; Condensed & Evaporated Milk; Ice Cream & Frozen Desserts; Fluid Milk. (2021; 2022; 2023; 2024; 2026)
16. Processed Food and Kindred Products	Canned & Cured Sea Foods; Canned Specialties; (2091; 2032; 2033; 2034; 2035; 2037; 2038; 2047; 2048; 2051; 2067; 2087; 2095; 2097; 2098; 2099; 2110; 2120; 2130; 2140)
17. Grain Milling/Flour	Flour & Other Grain Mill Prod.; Cereal Preparations; Rice Milling; (2041; 2043-2046)
18. Beverage Processing	Malt Liquors; Malt; Wines; (2082-2086)
19. Fats/Oils	Cottonseed Oil Mills; Soybean Oil Mills; Vegetable Oil Mills, N.E.C.; (2074-2077; 2079)
20. Food Services	5800; part of 70
