**Abstract**

This manuscript provides the basic documentation for a sophisticated input-output model, called **OHFOOD** for Ohio food. The model is designed specifically to capture the interdependencies and linkages among various industries composing the complex economy of Ohio. The input-output model of Ohio's economy also maintains a high degree of detail on the food and agricultural sectors. The interindustry model describes the linkages among various sectors of the economy and provides estimates of the economic influence that expansion of the agricultural and food sectors have on the general manufacturing and service sectors of the economy. Also, **OHFOOD** may be used to investigate the economic influence of "shocks" to the economy, such as entry of new firms into the state.

This documentation provides a succinct analysis of the importance of food and agriculture to the state's economy, based on the interindustry model. The analysis indicates that for 1992 the food and agricultural sectors of Ohio's economy contribute approximately 13 percent of the output, 11 percent of the value added, 16 percent of the total employment, and 11 percent of total income.

Of the 5 basic components within the food and forestry production and distribution chain, the food and forestry processing sector is the largest in terms of output, but the food and forestry wholesaling and retailing sectors and the food service sector are the most significant in terms of employment. The entire food and agriculture complex accounts for over 935,400 jobs in Ohio, or about 1 of every 6 jobs.

Keeping this model updated with the latest data available is an on-going task of the Farm Income Enhancement Program and the Agribusiness Research Group within the Department of Agricultural Economics of The Ohio State University.

## OHFOOD: An Ohio Food Industries Input-Output Model

### *Introduction*

Measuring production in an economy can be insightful in terms of relationships among various industrial groups. A technique known as input-output modeling endeavors to account for the interdependence of production activities of many different industries comprising the economy. The interdependence captured in the model arises because each industry employs the outputs of other industries as its raw materials. In addition, its output may be used by other producers, or industries, as a factor of production.

To illustrate linkages and interdependencies, consider corn production. Some output from this production activity is input into dry and wet corn milling. Some co-product output from milling is input into livestock feed (e.g. corn gluten feed) as is some output directly from corn production. Moving closer to the consumer level, some output from the milling industry is high-fructose corn syrup (HFCS) which in turn is input into the soft drink manufacturing industry. Quantifying, or measuring, these interdependencies and linkages can reveal how much of each industry's output is consumed by other industries compared to how much is available for final consumption or net output.

The food marketing system may be viewed as consisting of five basic components which are vertically linked and interdependent, in an economic sense. The five basic components are farm inputs and machinery, farm production, food and forestry processing, the wholesaling and retailing of food and forestry products, and ultimately food service.

A diagram of the simplified economic linkages among these five food and agriculturally-related components is provided in Figure 1. The four elliptical shapes of the diagram represent final demand components for the output of the other five stages. The arrows indicate economic flows, in terms of dollars of output, from one sector which becomes input to another sector.

For each industry or sector of the economy, estimates of the amount of direct purchases per dollar of output are obtained from the interindustry model. In addition, other economic measures of interest derived for each sector of the economy from the input-output model include total employment, value added, and the total dollar value of output. Each of these economic indicators measures different, yet related, interdependence among the various sectors of the economy.

Another useful indicator from input-output analysis is the "multiplier." An output multiplier for a sector, for example, measures the additional value of production of all sectors of the economy necessary to satisfy an extra dollar demanded from that specific sector. Output multipliers can be the basis for analyzing the importance of each industry in terms of its overall influence on the economy.

Other multipliers include income and employment. An income multiplier is a measure of the intuitive notion that income earned by one individual or industry is spent and becomes income to a second individual or industry. In turn, the second individual spends a portion of that income so that it becomes income to yet another individual. The income multiplier relates an increment in the income of one sector to an increment of

income of other sectors. In essence, when expenditures from one sector increase, the income of other sectors will increase in some multiple of the original increment.

Finally, employment multipliers are derived from output multipliers simply by converting from an output to employment base. The "total effect" multipliers indicate the number of jobs created for each \$1 million expansion in demand in their industries. The employment multiplier estimated here for each Ohio sector relates an increment in the employment within that sector to an increment in employment among all other sectors. These multipliers provide information on how much additional production or number of jobs will result from an increase in demand in a specified sector. Likewise, such a multiplier will indicate the total decline in production or number of jobs within the economy if curtailment occurs in a given sector. All of these measures serve to describe both the linkages among sectors within the economy and the relative importance of each sector to the total economy.

Simulation of the economic impact of new firms or changes in existing firms within an industry is one of the most powerful features of an input-output model. New firms may occur either through new plants or facilities that represent net additions to the industry, or by firms relocating to Ohio from outside Ohio. The model allows the Ohio economy to be "shocked" by adding a new firm of a specific output size, and to trace the influence of such an event on the entire economy, sector by sector. Such a simulation provides useful information for judging priorities on economic development within a geographic area. The input-output model enables "what-if" scenarios to be analyzed in terms of tracing the effects of changes in one sector on other sectors.

## *An Ohio Model: OHFOOD*

### **Sector Definition**

An input-output model of the state's economy captures interindustry economic relationships and provides information on the relative importance of various sectors of the economy. **OHFOOD**, an acronym for **Ohio Food**, is an input-output model composed of 43 sectors defined in a manner to emphasize agriculture and processed food and forestry products, distribution and retailing of food and forestry products, and food consumption. Many of the 43 sectors are defined based upon the aggregation of similar industries. For example, the "Nursery/Horticulture" sector of **OHFOOD** is defined to include the grass seeds industry, the greenhouse and nursery products industry, and the landscape and horticultural services industry.

The specific definition of sectors within **OHFOOD** was accomplished by maintaining substantial detail among the agricultural production and food-forestry processing-distribution sectors, but aggregating many other non-food industries into relatively large composite sectors. The specific food and related agricultural sectors of **OHFOOD** are farm inputs and machinery production, dairy farm products, poultry and egg production, cattle feeding, sheep and goat production (and other miscellaneous livestock), swine production, food grain production, feed grain production, hay/sugar/nut crop production (and other miscellaneous crops), fruits and vegetables, oil bearing crops, forestry/fishing production, nursery/horticulture production, meat and egg processing, dairy processing, processed food and kindred products, wood processing/paper production/wood furniture manufacturing, grain milling and flour production, beverage processing (mostly soft drink

and liquor production), fats and oils production, food and forestry wholesaling and retailing, and finally food service (restaurants, institutional, and other retail food service; excluding hotel and motel food service). **OHFOOD** is comprised of 22 sectors related to food and agriculture and 21 sectors which are based on the general manufacturing and service sectors of the entire economy. The precise and detailed four-digit 1992 Standard Industrial Classification (SIC) definition of each sector defined within OHFOOD is provided in Appendix Table A-1.

## Methods

The **OHFOOD** model is based on *IMPLAN*, an input-output algorithm for the national economy using non-survey based data (University of Minnesota). *IMPLAN* is based on a procedure developed by the U.S. Forest Service for estimating input-output models for the United States or subregions (Alward). Estimates of sectoral activity for final demand, final payments, industry output, and employment for the Ohio economy are based on the latest data available for 528 sectors of the United States economy. All price and output information within the model is in 1992 dollars. The technology matrix, often called a matrix of "technical coefficients," is based on 1982 relationships for the national economy. Again, these data are the latest published data available from the Bureau of Economic Analysis of the U.S. Department of Commerce at the time of this analysis. Detail of the methods of input-output modeling for an economy and the methods used for calculations of multipliers may be found in Miller and Blair.

An input-output model also may be used to identify the relative importance among various food and agriculture sectors of the economy in terms of their potential for increasing output in the general economy of Ohio. This type of analysis compares all industries or sectors based on their estimated output multipliers. The relative ranking of various sectors of the Ohio economy, in terms of influence or "ripple" effects on the rest of the economy, was calculated using the output multipliers reported in detail in Table 5. Prior to comparison among sectors, the output multipliers provided in Table 5 for each sector were deflated by their respective diagonal element of the Leontief inverse matrix, as reported in Table 4. This procedure allows a comparison based on the influence of each sector's output expansion potential, rather than a change in final demand within the Ohio economy.

### ***Analysis of the Ohio Economy***

#### **Basic Economic Linkages**

An overview of the Ohio economy in 1992 is shown by the total output, value added, and employment for each of 43 endogenous sectors, Table 1. The total economic output for Ohio in 1992 was \$447.4 billion, with total employment of just over 5.92 million persons. The output of food and related agricultural sectors was \$56.2 billion, or about 13 percent of Ohio's total economy, Figure 2. The \$56.2 billion represents about \$1 of every \$8 in output for the entire Ohio economy. The total output of \$56.2 billion may be divided among the five basic components of the food chain, Figure 2. The largest component is processing food and forestry products, accounting for over \$25.5 billion of this output, or

slightly over 45 percent of the total \$56.2 billion food and agriculture output. This \$25.5 billion is composed of \$16.9 billion from food processing and another \$8.6 from value added forestry processing which includes wood processing, paper, and wood furniture manufacturing. Thus, food processing accounts for about \$2 of every \$3 in output from the total food and forestry processing sector.

Agricultural production adds nearly \$5 billion in output, or about 9 percent of the total output from the food and related agricultural sectors of the Ohio economy. The largest component within the agricultural production sector is the nursery and horticultural industries, accounting for over \$1.4 billion in output, or about \$3 in every \$10 in output generated by the farming sector.

The Ohio livestock sectors combined account for over \$1.7 billion in output, or approximately 36 percent of the \$4.7 billion total agricultural production output, excluding forestry production and fishing, Figure 3. Crop and horticultural industries account for the other 65 percent of the total output from the primary agricultural production sectors of livestock, crops, and horticulture, or some \$3.2 billion in output, Figure 4. The largest component of the field crop sectors is oil bearing crops at over \$650 million in output. However, feed grain farm output nearly equals the economic output of the oil bearing crops sector.

Value added is another economic measure of interest. The total value added in the state's economy is \$240.5 billion, with 11 percent or about \$25.7 billion, as value added from the food and agricultural sectors, Figure 5. Of the \$25.7 billion value added by food and agriculture, 33 percent is attributable to the total food and forestry processing sector

while another 30 percent is from the wholesaling and retailing of food and forestry products. Food service accounts for almost \$5.0 billion value added, or about one-fifth of the total value added from all food and related agricultural sectors combined. Finally, the farming sector and the farm inputs and machinery sector each account for another 9 percent of the value added, or some \$2.4 billion each.

The food and related agricultural component of the state's economy contributes over 935,400 jobs, or nearly 1 in every 6 employed in Ohio, Figure 6. The wholesaling and retailing of food and forestry products combined with the food service sectors account for 7 of every 10 jobs in the food and related agricultural sectors, or nearly 647,000 jobs in total. The food and value added forestry processing sectors account for nearly 130,000 jobs, or nearly 14 percent of the total food and related agricultural sector employment. Farm production accounts for over 132,000 jobs and accounts for 1 of every 7 persons employed in the food and related agricultural sector. The smallest sector in terms of employment within the food and related agricultural component is farm inputs and machinery, yet this sector employs over 26,000 persons in Ohio, Table 1.

The food and agricultural complex accounts for over \$1 in every \$10 of total income in the entire state's economy, Figure 7. The food and forestry product processing sector accounts for about \$8.1 billion of a total food and related agricultural sector income of \$23.3 billion, or about 35 percent of the total food and related agricultural sector income. Food and forestry wholesaling and retailing accounts for another \$6.0 billion, while farm production income is \$2.3 billion, Table 1.

Ohio livestock sectors combined account for \$360 million in income, or approximately 16 percent of the \$2.3 billion total farming income, Figure 8. Dairy farms account for nearly 28 percent of total livestock sector output, while poultry and egg farms account for another 26 percent of the total income from the livestock sector. Cattle feeding accounts for another 23 percent of the total livestock sector income in Ohio.

Of the total Ohio farm income of \$2.3 billion for 1992, crops and horticulture account for over 84 percent, or \$1.9 billion, Figure 9. Nursery and Horticulture accounts for 56% of the total crops and horticulture income. The feed grains and oil bearing crop sectors each account for another 17 percent of the total crops and horticulture income.

Another significant aspect of the food and agricultural component of Ohio's economy is its contribution to exports. OHFOOD tracks exports to other states separately from exports to foreign countries, Table 6. Total food and related agricultural sector exports from Ohio to other states were \$22.6 billion in 1992, or nearly 15 cents of every dollar of domestic exports from the entire Ohio economy. Nearly 46 cents of every dollar of output from the food and related agricultural sectors was exported, compared to nearly 40 cents of every dollar of output for the entire Ohio economy.

Of the five major components of the food and agriculture complex, exports are most important to processing, Table 6. Examination of the food and agriculture component of exports to other states reveals that the processing sector exports \$14.6 billion, or 64 percent of the total food and related agricultural domestic exports of \$22.6 billion, Figure 10. Farm production exports around \$1.5 billion, or about 6 percent of the domestic export total.

Exports to foreign countries are largest for the processing sector at about \$1.1 billion, or 36 cents of every foreign export dollar from the food and agricultural component of Ohio's economy, Figure 11. Farmers and the farm input and machinery sectors combined account for another 49 cents of every foreign export dollar from Ohio's food and related agricultural sectors.

### **Industry Interdependence - Dollar Flows**

Input-output models consist of three main components: the transaction flow table, the technical coefficients table, and the interdependence coefficients table. The transaction flow table shows all the transactions between the various sectors in an economy. This table can be used to produce a table of technical coefficients which indicate the amount of each input required to produce one unit of output. The interdependence coefficients can be used to estimate the impact on the entire economy of a change in any one sector. The derivations and analysis of these tables follow.

The transactions flow table is the core of the input-output model. Information in this table is used to derive the other tables. The economy is divided into processing or production sectors, final demand sectors (household consumption and exports), and primary input sectors (labor and imports). The flow table is a matrix where each row shows the sales by the sector on the left side to each sector composing the columns of the table. Similarly, each column of the table shows the purchases by the sector of that column from each of the other sectors (comprising the rows of the table).

The Ohio transactions flow is in Table 2. An example of the interpretation of selected transaction flows recorded in Table 2 illustrates the meaning of the numbers in this table. To illustrate, the second column shows that dairy farms buy \$285,900 of inputs from other dairy farms, \$19.16 million worth from the hay/sugar/nut crops sector (primarily hay), \$30.64 million from the feed grains sector, \$101.0 million of labor, and \$332.0 million of imports to produce \$573.4 million in output. Imports are inputs purchased outside the region. Competitive imports are inputs purchased from sectors currently located in Ohio; non-competitive imports are inputs purchased from sectors not found in Ohio.

Interpretation of selected numbers from the second row of Table 2 shows that dairy farms' product sales are distributed as follows: \$285,900 sold to other dairy farms, \$616,330 to the cattle feeding sector, \$1.07 million to the feed grains sector, \$504.48 million to the dairy processing sector, \$977,290 to food service, and \$36.86 million to exports (outside Ohio) in the final demand sectors. In general, the columns provide the purchases from each sector of the economy while the rows provide the amount of output sold from the individual sector to each of the other sectors of the economy.

Finally, transactions within the transaction flows table are constrained by linear fixed coefficient production functions, so that total output is equal to total input for each processing sector. In most cases, exports or imports are treated as residual amounts so that this equality constraint is satisfied. The methods of input-output analysis require the exact sum of outputs to equal inputs for all 43 sectors.

## **Industry Interdependence - Purchases Per Dollar of Output**

The technical coefficients table is based on a fixed coefficient production function for each of the processing or production sectors. The table has estimates of the amount of input from each sector required to produce one unit of output. Technical coefficients are ratios of input from each sector to total inputs from all sectors, derived from the flow table. For example in column two of Table 3, the coefficient of labor input for dairy farms, 0.17606, is the ratio of \$100.95 million in labor input expenditures from column two of Table 2 to the \$573.35 million total input expenditures by Ohio dairy farms.

The coefficients of Table 3 are the value of input required from each sector to produce \$1.00 of output in each of the other sectors. For example, to produce \$1.00 in output from the Ohio cattle feeding sector requires about \$0.07 of expenditures in the cattle feeding sector, another \$0.03 in the Ohio feed grains sector and \$0.20 of labor. In the context of the input-output model, these technical coefficients are called the "direct" requirements for the production of each \$1 of output. This direct purchase of inputs from other sectors is an increase in demand for the output of the other sectors. This increase in demand, in turn, generates the "indirect" effects over several "rounds" of economic activity. That is, the direct effect generates first-round indirect effects, which generate second-round indirect effects, and so on. The direct plus all indirect effects equal the total effects shown by the interdependence coefficients.

## The Interdependence Coefficients Table

Each interdependence coefficient, provided in Table 4, represents the total value of input from each sector required to provide \$1.00 of output to final demand for the sector of concern. Each \$1.00 supplied to final demand requires more than \$1.00 of total output because of the intermediate product requirements of the processing sectors. For Ohio, to provide \$1.00 of farm inputs and machinery industries output to final demand requires total product of \$1.11986 from other firms in the same industry and about \$0.05 or less from any of the other sectors (first column of Table 4). In input-output terminology, Table 4 is a Type I table; only the processing sectors are used to generate the interdependence coefficients. This means that changes in labor earnings and regional consumption resulting from output changes do not "feed back" into the determination of total requirements for regional output. Only the direct effects of a change in final demand are incorporated.

In a Type II table, the effects generated by these indirect or secondary labor-consumption effects are called induced effects. To include the "feedback" or induced effects of changes in labor earnings and regional consumption on total requirements, the technical coefficients row for labor and the technical coefficients column for regional consumption are appended to Table 3. Exports and imports are still outside the model. The Type II interdependence coefficients table then also includes a labor row and a regional consumption column. See Richardson (1972) for further discussion of Type II effects.

An important issue in the specification of these tables is the response of other sectors to changes in demand for the output of a given sector. It is relatively easy to

estimate the actual transactions among the processing, the final demand, and the primary input sectors. If final demand for a sector increases, however, it is not necessarily true that each of the processing sectors from which inputs are purchased (and regional labor in a Type II model) will expand to provide the increase in inputs demanded by the given sector. If they do not expand, the necessary inputs, such as labor, will be imported. The activity instead "leaks" out of the region. In regions where capital and labor are fully employed, much of these indirect effects and even the direct effect are likely to come through regional imports. The effects then actually impact other regions rather than the one under study.

### **The Impact Multipliers**

Impact coefficients or multipliers are quantitative and summary measures of the total effects that a change in the final demand for a particular sector has on the output, total income, or employment of the Ohio economy.

The output multiplier of a particular sector measures the total change in output generated by a \$1.00 change in final demand for the product of a particular sector, Table 5. The multiplier is the sum of the interdependence coefficients and the total requirements for \$1.00 of final demand for that sector's column of the interdependence coefficients table. For example, the output multiplier for dairy farms of 1.3036 (Table 5) is the sum of the dairy farm products interdependence coefficients in that sector's column of Table 4.

The income and employment multipliers are similarly defined as the ratio of the total effect (direct plus indirect) to the direct effect. The direct effect is the income (employment) generated within the sector per unit of output. For example, the total effect

of each \$1.00 of output in dairy farm products generates about 62.3 cents of income; each \$1 million of output generates 23.0 person-years of employment, Table 5.

The total effect is the column sum of the interdependence coefficients for a particular sector multiplied by the direct effect of the sector from which the inputs are purchased. It is the summation of total income (employment) generated within each sector resulting from a change in the final demand for a specified sector. For example, a \$1.00 change in final demand for feed grain products generates total income of \$1.0398, where the direct effect is \$0.6131 and the indirect is \$0.4267, Table 5. Similarly, the total employment effect of a \$1 million change in final demand is about 25.1 person-years, of which about 12.4 person-years are direct effects and the remaining 12.7 person-years of employment are in indirect effects.

In Table 5, the income multiplier of 3.6085 for dairy farms is the ratio of 0.1728 to 0.6235. It means that each \$1.00 of income from dairy farms resulting from a change in final demand generates about \$3.61 in total economy-wide Ohio income. The employment multiplier of 2.2275 means that each \$1 million change in Ohio dairy farm output resulting from a change in final demand generates approximately 2.2 person-years change in total employment in Ohio.

### ***Conclusions***

OHFOOD is a sophisticated input-output model designed specifically to capture the interdependencies and linkages among various industries composing the complex economy of Ohio. The model is constructed so as to maintain meaningful detail on the

food and agricultural sectors. The input-output model offers some descriptive information on the importance of food and related agriculture to the economy of Ohio.

The documentation reported in this manuscript is intended only to provide a brief and summary view of the importance of food and related agriculture to the state's economy. Substantially more detail is available from the numbers reported in the tables.

The analysis indicates that the Ohio food and related agricultural sectors combined contribute approximately 13 percent of the output, 11 percent of the value added, 16 percent of the total employment, and 11 percent of total income. Of the 5 basic sectors within the food production and distribution chain, processing is the largest in terms of output, but the food and forestry wholesaling and retailing sectors and the food service sector are the most significant in terms of employment. The food and related agricultural sectors account for over 935,406 jobs in Ohio.

The OHFOOD model can be used to assess changes in the structure of the Ohio economy. Keeping the model updated with the latest information available will be an on-going task of the Farm Income Enhancement Program and the Agribusiness Research Group within the Department of Agricultural Economics of The Ohio State University.

Note: Each sector's output, value added, income, and employment are provided through U.S. Census information. The wholesaling and retailing sector is treated as one sector for purposes of the input-output model definition, but this sector is disaggregated for purposes of Table 1. The disaggregation procedure used is to estimate the percentage of all wholesale/retail payroll and employment solely from food wholesale/retail in Ohio using data published by County Business Patterns, 1991. The percentage of payroll (26.3%) is used to estimate the proportion of agriculture and food output, value added, and income. The percentage of employment (31.2%) is used to adjust employment in a similar fashion.

<sup>a</sup> Excludes hotel/motel food service.

**Table A-1. OHFOOD: Ohio Input-Output Model Sector Definitions**

Sector Name	Standard Industrial Classification (SIC)
<b><u>Food and Related Agriculture Sectors</u></b>	
1. Farm Inputs/Machinery	Industrial Inorganic; Nitro. Fertilizer; Agricultural Chemicals; Farm Machinery .... (2812-13; 2816; 2819; 2865; 2869; 2873-75; 2879; 3523-24; 3535; 3556)
2. Dairy Farms	0241; part of 0191, 0259, and 0291
3. Poultry and Egg	0251-0253; part of 0191, 0219, 0259, and 0291
4. Cattle Feeding	Ranch Fed Cattle; Range Fed Cattle; Cattle Feedlots. (0211; part of 0191, 0212, 0219, 0259, and 0291)
5. Swine	0213; part of 0191, 0219, 0259, and 0291
6. Other Livestock	Sheep, Lambs and Goats; Other Meat Animal Products; Misc. Livestock. (0214; 0271-72; part of 0191, 0219, 0259, 0273, 0279 and 0291)
7. Food Grains	0111; 0112; part of 0191, 0219, 0259, and 0291
8. Feed Grains	0115; part of 0139, 0191, 0219, 0259, and 0291
9. Other Crops	Cotton; Hay and Pasture; Tobacco; Tree Nuts; Sugar Crops; Misc Crops. (0131-33; part of 0119, 0139, 0173, 1079, 0191, 0219, 0259, and 0291)
10. Nursery/Horticulture	Grass Seeds; Greenhouse & Nursery Products; Landscape & Hort. Services. (0182; 0189; 0780; part of 0139, 0191, 0219, 0259, and 0291)
11. Fruits and Vegetables	Fruits; Vegetables. (0134; 0161; 0171-72; 0174-75; part of 0119, 0139, 0179, 0191, 0219, 0259, and 0291)
12. Oil Bearing Crops	0116; part of 0119, 0139, 0173, 0219, 0259, and 0291
13. Forestry/Fishing/ Ag Services	Forest Products; Forestry Products; Commercial Fishing. (0710; 0720; 0750; 0760; 0254; 0810; 0830; 0850; 0910; 0920; 0970; part of 0279)
14. Processed Meats/Eggs	Meat Packing Plants; Sausages & Other Prepared Meat; Poultry Dressing Plant; Poultry & Egg Processing; Fresh or Frozen Packaged Fish. (2011; 2013; 2015; 2092)
15. Dairy Processing	Creamery Butter; Cheese, Natural and Processed; Condensed & Evaporated Milk; Ice Cream & Frozen Desserts; Fluid Milk. (2021-2024; 2026)
16. Processed Food and Kindred Products	Canned & Cured Sea Foods; Canned Specialties; .... (2032-2035; 2037-2038; 2047-2048; 2051-2052; 2061-2063; 2065-2068; 2087; 2091; 2095; 2097; 2098-2099; 2110-2140)
17. Grain Milling/Flour	Flour & Other Grain Mill Prod.; Cereal Preparations; Rice Milling; .... (2041; 2043-2046)
18. Beverage Processing	Malt Liquors; Malt; Wines; .... (2082-2086)
19. Fats/Oils	Cottonseed Oil Mills; Soybean Oil Mills; Vegetable Oil Mills, N.E.C.; .... (2074-2077; 2079)
20. Food Services	5800
21. Wood/Paper	2410; 2421; 2426; 2429; 2431; 2434-2436; 2439; 2441; 2448-2449; 2452; 2491; 2493; 2499; 2511-2512; 2517; 2519; 2521; 2530; 2541; 2610-2630; 2650; 2671- 2672; 2674-2679

**Table A-1. OHFOOD: Ohio Input-Output Model Sector Definitions (Continued)**

Sector Name	SIC
<b><u>Non-Agricultural Sectors</u></b>	
22. Mining	1010-1030; 1041; 1044; 1060; 1080; 1094; 1099; 1200; 1310; 1320; 1410; 1420; 1440; 1450; 1474; 1475; 1479; 1480; 1490
23. Construction	1380; part of 15, 16, 17
24. Metal Industries	2514-2515; 2522; 2542-2599; 3312-3313; 3315-3317; 3320; 3331; 3334; 3339; 3340; 3261; 3353-3357; 3363-3366; 3369; 3398; 3399; 3411; 3412; 3421; 3423; 3425; 3429; 3431-3433; 3441-3444; 3446; 3448-3450; 3462-3466; 3469; 3471; 3479; 3482-3484; 3489; 3491-3494; 3498; 3495-3497; 3499; 3761; 3795
25. Apparel/Yarn/Leather	2210-2240; 2251-2254; 2257-2259; 2261-2262; 2269-2270; 2281-2284; 2295-2299; 2310-2380; 2391-2397; 2399; 3110; 3130; 3142-3144; 3149-3150; 3160; 3171-3172; 3190; 3965; 3991; 3996; 3999
26. Publishing	2410; 2421; 2426; 2429; 2431; 2434-2436; 2439; 2441; 2448; 2449; 2452; 2491; 2493; 2499; 2511; 2512; 2514; 2515; 2517; 2519; 2521; 2522; 2530; 2541; 2542; 2591; 2599; 2610-2630; 2650; 2710; 2720; 2731; 2732; 2671-2679; 2740-2770; 2782; 2789; 2791; 2796
27. Chemical/Petroleum	2673; 2821-2824; 2830; 2841-2844; 2850; 2861; 2891-2893; 2895; 2899; 2910; 2951; 2952; 2992; 2999; 3010-3030; 3052-3053; 3080
28. Stone/Clay/Glass	3210; 3221; 3229; 3230; 3240; 3251; 3253; 3255; 3259; 3261-3264; 3269; 3271-3275; 3280; 3291-3293; 3295-3297; 3299
29. Machinery and Equipment	3511; 3519; 3531-3534; 3536-3537; 3541-3549; 3552-3555; 3559; 3561-3569; 3581-3582; 3585; 3586; 3589; 3592; 3599; 3612-3613; 3621; 3625; 3629; 3631-3635; 3639; 3641; 3643-3648; 3825
30. Technology Industries	3571-3572; 3575; 3577-3579; 3596; 3593; 3594; 3651-3652; 3661; 3663; 3669; 3671-3679; 3691-3694; 3699; 3812; 3821-3827; 3829-3830; 3841-3845; 3850-3870; 3911; 3914-3915; 3930; 3942; 3944; 3949; 3951-3953; 3955; 3961
31. Motor Vehicle Equipment	2451; 3711; 3713-3716; 3721; 3724; 3728; 3731; 3732; 3740; 3750; 3764; 3769; 3792; 3799
32. Misc. Services	3993; 3995; 7000; 7210-7260; 7290; 7310-7320; 7331; 7334-7336; 7338; 7381-7383; 7389; 7340-7370; 7620-7640; 7690; 7510; 8710; 8730; 8740
33. Transportation/Communication	4010; 4040; 4100; 4200; 4400; 4500; 4720; 4730; 4783; 4785; 4810-4840; 4890; 7520; 7530; 7542; 7549; part of 4789
34. Electricity, Gas and Sanitary	4600; 4910; 4920; 4940; 4952-4953; 4959-4960; 4970; part of 493
35. All Wholesale/Retail Trade	5000-5570; 5900
35a. Food Wholesale/Retail Trade	5030; 5083; 5110; 5130; 5140; 5150; 5180; 5190; 5400; 5600
36. Financial/Legal	6000; 6100-6400; 6710; 6720; 6733; 6790; 8110; 8720; 8910; 8930; 8990
37. Real Estate/Development	6500
38. Recreation and Amusement	7800; 7910-7930; 7941; 7948; 7992-7993; 7996; 7997; 7999
39. Health Services	0740; 8010-8090; 8360
40. Education Services	8210-8240; 8290; 8230; 8350
41. Government and Nonprofit	4311; 6732; 8320; 8390; 8400; 8610-8660; 8690; 8922; part of 4100, 4190
42. Others	8800

Note: Food and non-food wholesale/retail trade are grouped together as Wholesale/Retail Trade in Tables 2-5.  
Food and non-food wholesale/retail trade are presented as separate categories in Table 1.

## **Appendix A-2**

### **STANDARD INDUSTRIAL CLASSIFICATION CODES A Brief Explanation**

The Standard Industrial Classification, or SIC, code is a commonly accepted means of classifying industries and is a federal government classification scheme. SIC's were developed under the direction of the Office of Management and Budget by the Technical Committee on Industrial Classification. The SIC code classifies establishments to the four-digit industry level by their primary type of activity. An additional four digits in the code narrows the classification down to a type of product. For example, in Sector 16 of Table B-1, processed food and kindred products, an eight digit SIC code identifies the industry group, industry, product class, and product. This is illustrated as follows:

<b><u>SIC Code</u></b>	<b><u>Level</u></b>	<b><u>Description</u></b>
20	Major Group	Food & Kindred Products
203	Industry Group	Canned Frozen & Preserved Fruits, Vegetables, & Food Specialties
2032	Industry	Canned Food Specialties
203202	Product Class	Ethnic Foods, canned & jarred
203202 12	Product	Tamales, packed in cans, jars

This study aggregates industries based on their four digit SIC definitions. Further detail, as shown above, is not necessary since this study aggregates on an industry basis. A particular item's location in the aggregation scheme can be identified by searching by its first four digits. The Standard Industrial Classification Manual can be found in any major library or is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC.
