OHFOOD: An Ohio Food Industries Input-Output Model

(Version 4.0, November 1997)

by
Thomas L. Sporleder¹

Abstract

OHFOOD, an acronym for **Ohio food**, is a sophisticated input-output model. The model is designed specifically to capture the inter-dependencies and linkages among various sectors and industries composing the complex economy of Ohio. The input-output model of Ohio's economy also maintains substantial detail on the food and agricultural sectors. The interindustry model describes the linkages among various sectors of the economy and provides estimates of the economic importance of the agricultural and food sectors, along with the general manufacturing and service sectors, of the economy. Also, **OHFOOD** may be used to investigate the economic influence of "shocks" to the economy, such as entry of new firms into the state.

This documentation provides a succinct analysis of the importance of food and agriculture to the state's economy, based on the interindustry model. The analysis indicates that for 1994 the food and agricultural sectors of Ohio's economy contribute approximately 13 percent of the output, 11 percent of the value added, 16 percent of the total employment, and 11 percent of total income. In 1994, the Ohio economy generated a gross domestic product (GDP) of \$275.1 billion, and the food and agricultural share of this GDP was \$31.3 billion, or \$11.38 of each \$100 in GDP for Ohio.

Of the 5 basic components within the food and forestry production and distribution chain, the processing sectors of food and forestry products are the largest in terms of output, but the food and forestry wholesaling and retailing sectors and the food service sector are the most significant in terms of employment. The entire food and agricultural complex accounted for over one million jobs in Ohio in 1994, or about 1 of every 6 jobs.

Keeping this model updated with the latest data available is an on-going task of the Farm Income Enhancement Program and the Agribusiness Research Group within the Department of Agricultural Economics of The Ohio State University.

¹Thomas L. Sporleder is Professor and Income Enhancement Endowed Chair, Department of Agricultural Economics, The Ohio State University. The author acknowledges computational and word processing support from Jo Anne Paynter, M.S. Graduate Student and Pam Brown, Administrative Assistant, Income Enhancement Program, both of the Department of Agricultural Economics, The Ohio State University.

OHFOOD: An Ohio Food Industries Input-Output Model

Introduction

Measuring production in an economy can be insightful in terms of relationships among various industrial groups. A technique known as input-output modeling endeavors to account for the interdependence of production activities of many different industries comprising the economy. The interdependence captured in the model arises because each industry employs the outputs of other industries as its raw materials. In addition, its output may be used by other producers or industries as a factor of production.

To illustrate these economic linkages and interdependencies, consider corn production. Some output from this production activity is input into dry and wet corn milling. Some co-product output from milling is input into livestock feed (e.g. corn gluten feed) as is some output directly from corn production. Moving closer to the consumer level, some output from the milling industry is high-fructose corn syrup (HFCS) which in turn is input into the soft drink manufacturing industry. Measuring these interdependencies and linkages can reveal how much of each industry's output is consumed by other industries and how much is available for final consumption.

The food marketing system may be viewed as consisting of five basic components which are vertically linked and interdependent, in an economic sense. The five basic components are farm inputs and machinery, farm production, processing of food and forestry products, wholesaling and retailing of food

and forestry products, and ultimately the food service sector. A diagram of the simplified economic linkages among the five food and agriculturally-related components is provided in Figure 1. The four elliptical shapes of the diagram represent final demand components for the output of the other five stages. The arrows indicate economic flows, in terms of dollars of output, from one sector that becomes input to another sector¹.

For each industry or sector of the economy, estimates of the amount of direct purchases per dollar of output are obtained from the interindustry model. In addition, other economic measures of interest derived for each sector of the economy from the input-output model include total employment, value added, and the total dollar value of output. Each of these economic indicators measures different, yet related, linkages among the various sectors of the economy.

Another useful indicator from input-output analysis is the "multiplier." An output multiplier for a sector, for example, measures the additional value of production of all sectors of the economy necessary to satisfy an extra dollar demanded from that specific sector. Output multipliers can be useful for analyzing the importance of each industry in terms of its overall influence on the economy.

Other multipliers include income and employment. An income multiplier is a measure

¹ For an excellent illustration of vertical linkages among the food processing, wholesaling and retailing, and food service sectors for the economy, see a recent article by John Siebert.

of the intuitive notion that income earned by one individual or industry is spent and becomes income to a second individual or industry. In turn, the second individual spends a portion of that income so that it becomes income to yet another individual. The income multiplier relates an increment in the income of one sector to an increment of income of other sectors. In essence, when expenditures from one sector increase, the income of other sectors will increase in some multiple of the original increment. Employment multipliers are derived from output multipliers simply by converting from an output to employment base.

Analysis of the economic impact of new firms or changes in existing firms within an industry is one of the most powerful features of an input-output model. New firms may occur either through new plants or facilities that represent net additions to the industry or by firms relocating to Ohio from outside Ohio. The model allows the Ohio economy to be "shocked" by adding a new firm of a specific output size. The influence of such an event on the entire economy can then be traced, sector by sector. Such a simulation provides useful information for judging priorities on economic development within a geographic area. The input-output model enables "what-if" scenarios to be analyzed in terms of tracing the effects of changes in one sector on other sectors.

An Ohio Model: OHFOOD

Sector Definition

An input-output model of the state's economy captures interindustry economic relationships and provides information on the relative importance of various sectors of the economy. **OHFOOD**, an acronym for **Ohio**

Food, is an input-output model composed of 43 sectors defined in a manner to emphasize agriculture and processed food and forestry products, distribution and retailing of food and forestry products, and food consumption. Many of the 43 sectors are defined based upon the aggregation of similar industries. For example, the "Nursery/Horticulture" sector of **OHFOOD** is defined to include the grass seeds industry, the greenhouse and nursery products industry, and the landscape and horticultural services industry.

The specific definition of sectors within **OHFOOD** was accomplished by maintaining substantial detail among the agricultural production and food-forestry processing/distribution sectors, but aggregating many other non-food industries into relatively large composite sectors. The specific food and related agricultural sectors of **OHFOOD** are farm inputs and machinery production, dairy farm products, poultry and egg production, cattle feeding, miscellaneous livestock (including sheep, goats, horses, and other livestock), swine production, food grain production, feed grain production, hay/sugar/nut crop production (and other miscellaneous crops), fruits and vegetables, oil bearing crops, forestry and fishing production, nursery and horticulture production, meat and egg processing, dairy processing, processed food and kindred products, wood processing and paper production and wood furniture manufacturing, grain milling and flour production, beverage processing (mostly soft drink and liquor production), fats and oils production, food and forestry wholesaling and retailing, and finally away-from-home food service (restaurants; institutions such as schools, hospitals, and prisons; and other retail food service; excluding hotel and motel food service). **OHFOOD** is comprised of 22 sectors related to food and agriculture and 21 sectors which are based on the general

manufacturing and service sectors of the entire economy. The precise and detailed four-digit 1994 Standard Industrial Classification (SIC) definition of each sector defined within **OHFOOD** is provided in Appendix Table A-1.

Methods

The **OHFOOD** model is based on *IMPLAN*, an input-output algorithm for the national economy using non-survey based data (University of Minnesota). *IMPLAN* is based on a procedure developed by the U.S. Forest Service for estimating input-output models for the United States or subregions (Alward). Estimates of sectoral activity for final demand, final payments, industry output, and employment for the Ohio economy are based on the latest data available for 528 sectors of the United States economy. All information within the model is in 1994 dollars. Detail of the methods of input-output modeling for an economy and the methods used for calculations of multipliers may be found in Miller and Blair.

Analysis of the Ohio Economy

Basic Economic Linkages

An overview of the Ohio economy in 1994 is shown by the total output, value added, income and employment for each of 43 sectors, Table 1. The total economic output for Ohio in 1994 was \$525.3 billion, with total employment of over 6.2 million persons. The 1994 Ohio economy generated a gross domestic product (GDP) of \$275.1 billion, and the food and agricultural share of this GDP was \$31.3 billion. This means that the food and agricultural components of the

Ohio economy generate approximately \$11.38 of each \$100 in Ohio GDP.

The output of food and related agricultural sectors was \$67.7 billion, or about 13 percent of Ohio's total economy, Figure 2. The \$67.7 billion represents about \$1 of every \$8 in output for the entire Ohio economy. The total output of \$67.7 billion may be divided among the five basic components of the food chain, Figure 2. The largest component is processed food and processed forestry products, accounting for just over \$27 billion of this output, or 40 percent of the total \$67.7 billion food and agricultural output. This \$27.0 billion is composed of \$16.9 billion from food processing and another \$10.1 from value added forestry processing which includes wood processing, paper, and wood furniture manufacturing. Thus, food processing accounts for about 63 cents of every \$1 in output from the total food and forestry processing sector.

Agricultural production adds over \$5.4 billion in output, or about 8 percent of the total output from the food and related agricultural sectors of the Ohio economy. The largest component within the agricultural production sector is the nursery and horticultural industries, accounting for over \$1.1 billion in output, or about \$1 of every \$5 in output generated by the farming sector. However, the oil bearing crops production sector, primarily soybeans, is a close second in terms of output. This sector accounts for over \$1 billion in sector output.

The Ohio livestock sectors combined account for over \$1.4 billion in output, or approximately 28 percent of the \$5.4 billion total agricultural production output, excluding forestry production and fishing, Figure 3. Crop and horticultural industries account for the other 72 percent of the total output from

the primary agricultural production sectors of livestock, crops, and horticulture, or some \$5.1 billion in output, Figure 4. The largest component of the field crop sectors is oil bearing crops at over \$1 billion in output. However, the feed grain industries in the farm production sector also contribute another \$889.8 million in output.

Value added is another significant measure of economic activity and is a useful measure in comparison of the relative importance of one sector to another. Value added for the total economy is approximately equivalent to the measure called gross domestic product (GDP). As stated earlier, the 1994 Ohio economy generated a gross domestic product (GDP) of \$275.1 billion and the food and agricultural share of this GDP was \$31.3 billion, Table 1. This means that the food and agricultural components of the Ohio economy generated approximately \$11.38 of each \$100 in Ohio GDP. Of the \$31.3 billion value added by food and agriculture, 31 percent is attributable to the total food and forestry processing sector while another 32 percent is from the wholesaling and retailing of food and forestry products, Figure 5. Food service accounts for almost \$5.2 billion value added, or about one-sixth of the total value added from all food and related agricultural sectors combined. Finally, the farming sector and the farm inputs and machinery sector account for another 10 and 11 percent, respectively, of the value added. Each sector accounts for over \$3 billion in value added.

The food and related agricultural component of the state's economy contributes over one million jobs, or nearly 1 in every 6 employed in Ohio, Figure 6. The wholesaling and retailing of food and forestry products combined with the food service sectors account for 7 of every 10 jobs in the food and related agricultural sectors, or over 705,000 jobs in total. The food and value added forestry

processing sectors account for nearly 136,000 jobs, or nearly 14 percent of the total food and related agricultural sector employment. Farm production accounts for nearly 135,000 jobs and about 1 of every 7 persons employed in the food and related agricultural sector. The smallest sector in terms of employment within the food and related agricultural component is farm inputs and machinery, yet this sector employs over 32,000 persons in Ohio, Table 1.

The food and agricultural complex accounts for about 11 percent of total income in the entire state's economy, Figure 7. The food and forestry product processing sector accounts for about \$9.6 billion of a total food and related agricultural sector income of \$29.3 billion, or nearly 33 percent of the total food and related agricultural sector income. Food and forestry wholesaling and retailing accounts for another \$8.5 billion, while farm production income is \$3.2 billion, Table 1.

Ohio livestock sectors combined account for about \$626 million in income, or approximately one-fifth of the \$3.1 billion total farming income, Figure 8. Dairy farms account for 40 percent of total livestock sector output, while poultry and egg farms account for another 24 percent of the total income from the livestock sector. Cattle feeding accounts for another 18 percent of the total livestock sector income in Ohio.

Of the total Ohio livestock, crop and horticultural income of \$3.1 billion for 1994, crops and horticulture account for 79 percent, or \$24 billion, Figure 9. Nursery and horticulture accounts for 31% of the total crops and horticulture income. The feed grains and oil bearing crop sectors each account for one-half of the total crops and horticulture income.

Another significant aspect of the food and agricultural component of Ohio's economy is its contribution to exports. **OHFOOD** tracks exports to other states separately from exports to foreign countries, Table 2. Total food and related agricultural sector exports from Ohio to other states were \$17.9 billion in 1994, or over 11 cents of every dollar of domestic exports from the entire Ohio economy. Nearly 32 cents of every dollar of output from the food and related agricultural sectors was exported, compared to nearly 36 cents of every dollar of output for the entire Ohio economy.

Of the five major components of the food and agriculture complex, exports are most important to processing, Table 3. Examination of the food and agriculture component of exports to other states reveals that the processing sector exports \$11.5 billion, or 64 percent of the total food and related agricultural domestic exports of \$17.9 billion, Figure 10. Farm production exports around \$2.5 billion, or about 8 percent of the domestic export total.

Exports to foreign countries are largest for the processing sector at about \$1.1 billion, or 30 cents of every foreign export dollar from the food and agricultural component of Ohio's economy, Figure 11. Farming and the farm input and machinery sectors combined account for another 58 cents of every foreign export dollar from Ohio's food and related agricultural sectors.

The Impact Multipliers

Impact coefficients or multipliers are quantitative and summary measures of the total effects that a change in the final demand for a particular sector has on the output, value added, total income, or employment of the Ohio economy.

The output multiplier of a particular sector measures the total change in output generated by a \$1.00 change in final demand for the product of a particular sector (Table 3).

Other multipliers are calculated for value added, income and employment. For example, a \$1.00 change in final demand for feed grain products generates total economy-wide income of \$1.6969, Table 3. Similarly, the employment multiplier for the feed grains sector is 1.3893. The total employment effect for a \$1 million change in final demand is about 1.4 person-years.

In Table 3, the dairy production income multiplier is 1.6152. It means that each \$1.00 of income from dairy farms resulting from a change in final demand generates about \$1.62 in total economy-wide Ohio income. The employment multiplier of 2.1029 means that each \$1 million change in Ohio dairy farm output resulting from a change in final demand generates approximately 2.1 person-years change in total employment in Ohio.

Conclusions

OHFOOD, an acronym for **Ohio food**, is a sophisticated input-output model. The model is designed specifically to capture the inter-dependencies and linkages among various sectors and industries composing the complex economy of Ohio. The input-output model of Ohio's economy also maintains substantial detail on the food and agricultural sectors. The interindustry model describes the linkages among various sectors of the economy and provides estimates of the economic importance of the agricultural and food sectors, along with the general manufacturing and service sectors, of the economy. Also, **OHFOOD** may be used to investigate the economic influence of

"shocks" to the economy, such as entry of new firms into the state.

This documentation provides a succinct analysis of the importance of food and agriculture to the state's economy, based on the interindustry model. The analysis indicates that for 1994 the food and agricultural sectors of Ohio's economy contribute approximately 13 percent of the output, 11 percent of the value added, 16 percent of the total employment, and 11 percent of total income. In 1994, the Ohio economy generated a gross domestic product (GDP) of \$275.1 billion and the food and agricultural share of this GDP was \$31.3 billion, or \$11.38 of each \$100 in GDP for Ohio.

Of the 5 basic components within the food and forestry production and distribution chain, the processing sectors of food and forestry products is the largest in terms of output, but the food and forestry wholesaling and retailing sectors and the food service sector are the most significant in terms of employment. The entire food and agricultural complex accounted for over one million jobs in Ohio in 1994, or about 1 of every 6 jobs.

Keeping this model updated with the latest data available is an on-going task of the Farm Income Enhancement Program and the Agribusiness Research Group within the Department of Agricultural Economics of The Ohio State University.

Note: Each sector's output, value added, income, and employment are provided through U. S. Census information. The wholesaling and retailing sector is treated as one sector for purposes of the input-output model definition, but this sector is disaggregated for purposes of Table 1. The disaggregation procedure used is to estimate the percentage of all wholesale/retail payroll and employment solely from food wholesale/retail in Ohio using data published by County Business Patterns, 1994. The percentage of payroll (24.17%) is used to estimate the proportion of agriculture and food output, value added, and income. The percentage of employment (29.1%) is used to adjust employment in a similar fashion.

a Sheep, goats and horses

b Excludes hotel/motel food service.

Table A-1. OHFOOD: Ohio Input-Output Model Sector Definitions

Sector Name	Standard Industrial Classification (SIC)
<u>Food and Related Agriculture Sectors</u>	
1. Farm Inputs/Machinery	Industrial Inorganic; Nitro. Fertilizer; Agricultural Chemicals; Farm Machinery (2812-13; 2816; 2819; 2865; 2869; 2873-75; 2879; 3523-24; 3535; 3556)
2. Dairy Farms	0241; part of 0191, 0259, and 0291
3. Poultry and Egg	0251-0253; part of 0191, 0219, 0259, and 0291
4. Cattle Feeding	Ranch Fed Cattle; Range Fed Cattle; Cattle Feedlots. (0211; part of 0191, 0212, 0219, 0259, and 0291)
5. Swine	0213; part of 0191, 0219, 0259, and 0291
6. Other Livestock	Sheep, Lambs and Goats; Other Meat Animal Products; Misc. Livestock. (0214; 0271-72; part of 0191, 0219, 0259, 0273, 0279 and 0291)
7. Food Grains	0111; 0112; part of 0191, 0219, 0259, and 0291
8. Feed Grains	0115; part of 0139, 0191, 0219, 0259, and 0291
9. Other Crops	Cotton; Hay and Pasture; Tobacco; Tree Nuts; Sugar Crops; Misc Crops. (0131-33; part of 0119, 0139, 0173, 1079, 0191, 0219, 0259, and 0291)
10. Nursery/Horticulture	Grass Seeds; Greenhouse & Nursery Products; Landscape & Hort. Services. (0182; 0189; 0780; part of 0139, 0191, 0219, 0259, and 0291)
11. Fruits and Vegetables	Fruits; Vegetables. (0134; 0161; 0171-72; 0174-75; part of 0119, 0139, 0179, 0191, 0219, 0259, and 0291)
12. Oil Bearing Crops	0116; part of 0119, 0139, 0173, 0219, 0259, and 0291
13. Forestry/Fishing/ Ag Services	Forest Products; Forestry Products; Commercial Fishing. (0710; 0720; 0750; 0760; 0254; 0810; 0830; 0850; 0910; 0920; 0970; part of 0279)
14. Processed Meats/Eggs	Meat Packing Plants; Sausages & Other Prepared Meat; Poultry Dressing Plant; Poultry & Egg Processing; Fresh or Frozen Packaged Fish. (2011; 2013; 2015; 2092)
15. Dairy Processing	Creamery Butter; Cheese, Natural and Processed; Condensed & Evaporated Milk; Ice Cream & Frozen Desserts; Fluid Milk. (2021-2024; 2026)
16. Processed Food and Kindred Products	Canned & Cured Sea Foods; Canned Specialties; (2032-2035; 2037-2038; 2047-2048; 2051-2052; 2061-2063; 2065-2068; 2087; 2091; 2095; 2097; 2098-2099; 2110-2140)
17. Grain Milling/Flour	Flour & Other Grain Mill Prod.; Cereal Preparations; Rice Milling; (2041; 2043-2046)
18. Beverage Processing	Malt Liquors; Malt; Wines; (2082-2086)
19. Fats/Oils	Cottonseed Oil Mills; Soybean Oil Mills; Vegetable Oil Mills, N.E.C.; ... (2074-2077; 2079)
20. Food Services	5800
21. Wood/Paper	2410; 2421; 2426; 2429; 2431; 2434-2436; 2439; 2441; 2448-2449; 2452; 2491; 2493; 2499; 2511-2512; 2517; 2519; 2521; 2530; 2541; 2610-2630; 2650; 2671-2672; 2674-2679

42. Others	8800

Note: Food and non-food wholesale/retail trade are grouped together as Wholesale/Retail Trade in Tables 2-5.
Food and non-food wholesale/retail trade are presented as separate categories in Table 1.

Appendix A-2

STANDARD INDUSTRIAL CLASSIFICATION CODES

A Brief Explanation

The Standard Industrial Classification, or SIC, code is a commonly accepted means of classifying industries and is a federal government classification scheme. SIC's were developed under the direction of the Office of Management and Budget by the Technical Committee on Industrial Classification. The SIC code classifies establishments to the four-digit industry level by their primary type of activity. An additional four digits in the code narrows the classification down to a type of product. For example, in Sector 16 of Table A-1, processed food and kindred products, an eight digit SIC code identifies the industry group, industry, product class, and product. This is illustrated as follows:

SIC Code	Level	Description
20	Major Group	Food & Kindred Products
203	Industry Group	Canned Frozen & Preserved Fruits, Vegetables, & Food Specialties
2032	Industry	Canned Food Specialties
203202	Product Class	Ethnic Foods, canned & jarred
203202 12	Product	Tamales, packed in cans, jars

This study aggregates industries based on their four digit SIC definitions. Further detail, as shown above, is not necessary since this study aggregates on an industry basis. A particular item's location in the aggregation scheme can be identified by searching by its first four digits. The Standard Industrial Classification Manual can be found in any major library or is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC.

Appendix B

Industry Interdependence - Dollar Flows

Input-output models provide information on: the transaction flows table and the technical coefficients for each sector. The transaction flows table (Table B-1) shows all the transactions between the various sectors in an economy. This table can be used to produce a table of technical coefficients (Table B-2) which indicate the amount of each input required to produce one unit of output. The derivations and analysis of these tables follow.

The transactions flow table (Table B-1) is the core of the input-output model. Information in this table is used to derive the other tables. The economy is divided into processing or production sectors, final demand sectors (household consumption and exports), and primary input sectors (labor and imports). The flow table is a matrix where each row shows the sales by the sector on the left side to each sector composing the columns of the table. Similarly, each column of the table shows the purchases by the sector of that column from each of the other sectors (comprising the rows of the table).

The Ohio transactions flow is in Table B-1. An example of the interpretation of selected transaction flows recorded in Table B-1 illustrates the meaning of the numbers in this table. To illustrate, the second column shows that dairy farms buy \$6,730 of inputs from other dairy farms, \$21.21 million worth from the hay/ sugar/nut crops sector (primarily hay), \$18.05 million from the feed grains sector, \$249.4 million of labor, and \$155.1 million of imports to produce \$512.3 million in output. Imports are inputs purchased outside the region.

Interpretation of selected numbers from the second row of Table B-1 shows that dairy farms' product sales are distributed as follows: \$6,730 sold to other dairy farms, \$83,590 to the cattle feeding sector, \$1.1 million to the feed grains sector, \$443.95 million to the dairy processing sector, \$9.0 million to food service, and \$182.1 million to exports (outside Ohio) in the final demand sectors. In general, the columns provide the purchases from each sector of the economy while the rows provide the amount of output sold from the individual sector to each of the other sectors of the economy.

Finally, transactions within the transaction flows table are constrained by linear fixed coefficient production functions, so that total output is equal to total input for each processing sector. In most cases, exports or imports are treated as residual amounts so that this equality constraint is satisfied. The methods of input-output analysis require the exact sum of outputs to equal inputs for all 43 sectors.

Industry Interdependence - Purchases Per Dollar of Output

The technical coefficients table is based on a fixed coefficient production function for each of the processing or production sectors. The table has estimates of the amount of input from each sector required to produce one unit of output. Technical coefficients are ratios of input from each sector to total inputs from all sectors, derived from the flow table. For example, in column two of Table B-2, the coefficient of labor input for dairy farms, 0.48679, is the ratio of \$249.38 million in labor input expenditures from column two of Table B-1 to the \$512.28 million total input expenditures by Ohio dairy farms.

The coefficients of Table B-2 are the value of input required from each sector to produce \$1.00 of output in each of the other sectors. For example, to produce \$1.00 in output from the Ohio cattle feeding sector requires about \$0.03 of expenditures in the cattle feeding sector, another \$0.03 in the Ohio feed grains sector and \$0.47 of labor. In the context of the input-output model, these technical coefficients are called the "direct" requirements for the production of each \$1 of output. This direct purchase of inputs from other sectors is an increase in demand for the output of the other sectors. This increase in demand, in turn, generates the "indirect" effects over several "rounds" of economic activity. That is, the direct effect generates first-round indirect effects, which generate second-round indirect effects, and so on.

Table B-1. Transactions Flows for Ohio, 1994

	Farm Inputs & Machinery	Dairy Farms	Poultry & Egg	Cattle Feeding	Swine	Sheep & Goats	Food Grains	Feed Grains	Nursery & Horticulture	Fruits & Vegetables	Oil Bearing Crops
